TABLES OF COMPOUND INTEREST,

FOR EACH RATE BETWEEN $\frac{1}{2}$ AND 10 PER CENT.

PER ANNUM, PROCEEDING BY INTERVALS
OF ONE-EIGHTH,

AND FROM

1 YEAR TO 100 YEARS.

-
- I. Present Value of £1 receivable at the end of each Year.
 - II. Present Value of £1 per Annum receivable at the end of each Year.
 - III. Amount of £1 at the end of each Year.
 - IV. Amount of £1 per Annum at the end of each Year.
-

INTRODUCTION.

EXISTING tables of the Values of Sums and of Annuities are so numerous, that justification of the present addition to their number will be looked for. This will be found, it is thought, in the circumstance that the present tables are adapted to a greater number of rates of interest than any of their predecessors. The most extensive tables of this kind known to the Author, are Rance's, which are adapted to rates from $\frac{1}{4}$ to 10 per cent., ascending from the lower limit to the higher by steps of $\frac{1}{4}$ per cent.; while in the present tables, in which the limits are $\frac{1}{2}$ and 10 per cent., the ascent is by steps of $\frac{1}{8}$ per cent. The number of the rates here given, consequently, is nearly double that given by Rance.

The arrangement adopted in the present tables differs also from that used in most, if not all, previous tables of the same kind. In the tables referred to, the second halves of the columns corresponding to the several rates, are separated from the first by an interval of several pages; in consequence of which, the use of the tables is seriously impeded. Here the arrangement is such, that on each opening of the book we are presented with four *complete* columns, corresponding to four different rates. Very little practice in the use of the tables will be

needed to enable the advantage gained by this change to be duly appreciated.

In previous tables the values have been carried out to six, seven, and sometimes eight places of decimals. In those hereto appended, the number of decimal places is restricted to five, which, it is believed, will be found to be sufficient for nearly every purpose; while the use of the tables is much facilitated in consequence of the restriction.

The present volume comprises two classes of Tables, first, PRESENT VALUES of £1, and of Annuities of £1; and, secondly, AMOUNTS of £1, and of Annuities of £1. And these are given at seventy-five different rates of interest, ranging from $\frac{1}{2}$ to 10 per cent; and for all terms of years not exceeding one hundred.

The two classes of Tables will be exemplified in order.

I.—OF THE TABLES OF PRESENT VALUES.

The Present Value at a specified rate, of £1, due at the end of a specified number of years, is the sum which, improved at the specified rate, would at the end of the term amount to £1. Thus, the present value at 3 per cent. of £1 due in 10 years, being (p. 10) $.74409 = 14s. 10\frac{1}{2}d.$, this is the sum which would at 3 per cent. amount to £1 in 10 years. And if the sum due were £100, its present value would be $.74409 \times 100 = 74.409 = £74. 8s. 2d.$, which at 3 per cent., would amount in 10 years to £100.

The Present Value, at a specified rate, of an annuity of £1 for a specified number of years, is the sum which, improved at the specified rate during the term, would provide for the annual payments as they severally become due. Thus (p. 48),

$8\cdot53020 = £8. 10s. 7d.$, being the present value, at 3 per cent., of an annuity of £1 during the next 10 years, it is the sum which, invested now and improved at 3 per cent, would just provide, at their maturity, for the 10 annual payments. And if the annuity were £100, the present sum required to provide for the successive payments would be $8\cdot53020 \times 100 = 853\cdot020 = £853. 0s. 5d.$

It is to be always borne in mind that an annuity, unless described as *due*, makes its successive payments at the *end* of each year during its subsistence ; but, if described as *due*, it is to be understood that the payments are made at the *beginning* of each year. From which it appears that, in the case of an ordinary annuity *now constituted*, the first payment will be made a year hence ; while in the case of an annuity *due*, the first payment will be made now.

It is to be further noted, that when an annuity is spoken of, unless otherwise stated, an annuity of £1 is meant. And a result obtained for an annuity of £1, will be adapted to an annuity whose payments are other than £1, by multiplying it by the number of pounds in one of the payments in question.

The values here recorded are those of ordinary annuities, making their payments at the end of each year ; but the tables can be readily applied to finding the values of annuities due, which make their payments at the beginning of each year. Thus, an annuity *due* for 10 years, making 10 annual payments, the first now, is equivalent to a tabular annuity during the next 9 years, which, in addition to its ordinary payments, makes also one payment now. The value of the annuity due, therefore, is obtained by adding to the tabular value of an annuity for one year less than the nominal term, that of the present payment, £1.

Thus, the value of an annuity due for 10 years, at 3 per cent., is (p. 48) $778611 + 1 = 878611 = £8. 15s. 9d.$, which exceeds that of the ordinary annuity, making the same number of payments, by 5s. 2d.

The values of annuities given *directly* by the tables, are the values at the time the annuities are entered upon. But it is frequently required to assign the value of an annuity which is not to be entered upon till after the lapse of a given number of years. The annuity is said, in such case, to be *deferred* for the specified number of years, and its value can be very readily deduced from the tables.

The rule is:—From the value of an annuity whose duration is that of the proposed annuity and of the period of deferment together, subtract the value of an annuity whose duration is the period of deferment. The remainder is the required value.

This will be best illustrated by a few examples:—

Example 1.—Required the value, at 5 per cent., of an annuity for 20 years, deferred 10 years.

$$20 + 10 = 30.$$

Value of annuity for 30 years 15.37245 p. 56.

" " 10 " 7.72173 "

Difference 7.65072 = £7:13, Value req^d.

Example 2.—Required the value, at 4 per cent., of an annuity for 7 years, deferred 3 years.

$$7 + 3 = 10.$$

Value of annuity for 10 years... 8.11090 p. 52.

" " 3 " ... 2.77509 "

Difference 5.33581 = £5:6:9

Example 3.—Required the value, at 6 per cent., of a perpetuity, to be entered upon in 11 years.

Value of perpetuity	16·66667	p. 77.
" annuity for 11 years			7·88687	" 60.
Difference	8·77980	= £8 : 15 : 7

In the preceding examples, the values of the proposed annuities are referred to epochs antecedent to the dates of their being respectively entered upon. By the application of a general principle, however, we can, by aid of the tables, assign the value of an annuity, with reference to any epoch, whether antecedent or subsequent to the date of its being entered upon, or during its subsistence, as required. The principle is, that the value of an annuity varies during a specified interval in the same ratio as the value of £1 (at the same rate), during the same interval. Hence the following rules:—

1. If the epoch to which the value is to be referred be *antecedent* to the date at which the annuity is to be entered upon,—that is, if the annuity whose value is required be a deferred annuity,—*multiply* the tabular value by the value of £1, due at the end of the number of years contained in the interval through which the transference is to be made.
2. If, on the other hand, the epoch of reference be *subsequent* to the date of entering upon the annuity, *divide* the tabular value by the value of £1, due at the end of the number of years equal to the interval through which the value is to be transferred.

Example 4.—Required the value, at 5 per cent., of an annuity for 20 years, deferred 10 years.

Value of annuity for 20 years...	12·46221	p. 56.
" £1 due in 10 "	6·1391	" 18.
Product	...	7·65068 = £7 : 13 : 0

Example 5.—Required the value, at 4 per cent., of an annuity for 7 years, deferred 3 years.

$$\begin{array}{lll}
 \text{Value of annuity for 7 years} & \dots & 6.00205 \text{ p. 52.} \\
 \text{,} & \text{£1 due in 3} & \dots \quad \underline{.88900} \quad \text{, 14.} \\
 \text{Product} & \dots & 5.33582 = \text{£5.6:9}
 \end{array}$$

Example 6.—Required the value, at 6 per cent., of a perpetuity deferred 11 years.

$$\begin{array}{lll}
 \text{Value of perpetuity} & \dots & 16.66667 \text{ p. 77.} \\
 \text{,} & \text{£1 due in 11 years} & \dots \quad \underline{.52679} \quad \text{, 22.} \\
 \text{Product} & \dots & 8.77984 = 8.15:7.
 \end{array}$$

Examples 4 to 6 are the same as examples 1 to 3, but differently worked. It will be observed that there are slight discrepancies between the results of the two methods. The reason is, that in the product of two interminate numbers we cannot generally have more significant figures correct than there are of such in that one of the factors which has the fewest of them. So in examples 4 to 6, five being the number of significant figures in the factor having the fewest, we have only five figures true in the results, as appears on comparison of these with the results of examples 1 to 3, which are correct.

Example 7.—Find the value of a perpetuity, at 6 per cent., when deferred 100 years.

$$\begin{array}{lll}
 \text{Value of perpetuity} & \dots & 16.66667 \text{ p. 77.} \\
 \text{,} & \text{£1 due in 100 years} & \dots \quad \underline{.00295} \quad \text{, 23.} \\
 \text{Product} & \dots & .04917
 \end{array}$$

The true value here, as found by the first method, is .04912, so that there are only three significant figures true, the same being the number in the smaller factor.

Fortunately there is no *necessity* for using, in the formation of the value of a deferred annuity, the method which gives the less correct results. The method preferable in this respect is also much the easier of the two.

Example 8.—Find the value, at 5 per cent., of an annuity for 10 years, entered upon 15 years ago.

Value of annuity for 10 years ... 7·72173 p. 56.

„ £1 due in 15 „ ... 48102 „ 18.

Quotient 16·0528 = £16:1:1.

This is the sum to which the annuity would now amount if its payments had been invested as received, and improved at 5 per cent. And it is consequently what would have to be refunded if the title of the recipient should be now invalidated.

Example 9.—Required the value, at 4 per cent., of an annuity for 15 years, entered upon 5 years ago.

Value of annuity for 15 years ... 11·111839 p. 52.

„ £1 due in 5 „ ... 82193 „ 14.

Quotient 13·5272 = £13:10:7

This sum is made up of the two following items, first, the amount of the five payments already made, improved at 4 per cent.; and, secondly, the sum requisite to provide for the remaining 10 payments, in other words, the value of an annuity for 10 years, now entered upon. This can be easily verified.

Example 10.—Find the value, at 4 per cent., of an annuity for 20 years, entered upon 20 years ago.

Value of annuity for 20 years ... 13·59033 p. 52.

„ £1 due in 20 „ ... 45639 „ 14.

Quotient 29·7779 = £29:15:7

When the epoch to which the value of an annuity is referred is the date of the last payment (such payment being supposed to have been just made), the value is called the *amount* of the annuity during the term. So the value here found is the *amount* of an annuity in 20 years, at 4 per cent.

It is seen from this that questions having reference to the AMOUNTS of annuities, admit of solution by aid of the Tables of PRESENT VALUES. The legitimate, as it is also the easier, and more direct method of dealing with such, is by the use of the Tables of AMOUNTS. To those we shall come presently.

Annuities are frequently payable by instalments, equal in amount, and at equal intervals during each year of their subsistence; and they are said to be payable half-yearly, quarterly, &c., according as the instalments fall to be paid twice, four times, &c., a year. The value of an annuity is obviously increased by an increase in the frequency of its payments, the annual amount remaining the same. It is necessary to show how the tables may be applied to find the values of annuities payable by instalments.

The annuity values in the tables are values of series of periodical payments at intervals of a year, a year being also the time during which the nominal interest accrues, and they are accommodated to the purpose now in view by using the *number of intervals* between the date of entering upon the annuity and that of its last payment instead of the tabular *number of years*, the proper aliquot part of the nominal rate of interest, and the corresponding aliquot part of £1 for the amount of each payment.

Example 11.—Required the value, at 5 per cent., of an annuity for 20 years, payable half-yearly.

This is dealt with as an annuity of £ $\frac{1}{2}$, for $20 \times 2 = 40$ intervals, at $5 \div 2 = 2\frac{1}{2}$ per cent. Thus :—

Val. of an. of £1 in 40 intervals, at $2\frac{1}{2}$ per c. 25.10277 p. 46

$$\text{“ “ } \underline{\underline{L\frac{1}{2}} \text{ “ “ } 12.55139 = L12:11}$$

Example 12.—Find the value of the same annuity when payable quarterly.

Val. of an. of £1 in 80 intervals, at $1\frac{1}{4}$ perc. 50.38666 p. 41.

$$\text{“ “ } \underline{\underline{L\frac{1}{4}} \text{ “ “ } 12.59666 = L12:11:11}$$

The value of this annuity, when payable in the ordinary way, once a year, is (p. 56) $12.46221 = L12:9:3$, so that the increase due to the greater frequency of the payments is less than would probably have been anticipated. It is noticeable that the sum here determined as the value of the annuity when payable quarterly, would, if invested in the purchase of a like annuity, payable yearly, yield the purchaser just $4\frac{1}{2}$ per cent. See p. 54.

Example 13.—Required the value, at $3\frac{1}{2}$ per cent., of an annuity for 25 years, payable half-yearly.

Val. of an. of £1 in 50 intervals, at $1\frac{7}{8}$ per c. 33.14121 p. 42.

$$\text{“ “ } \underline{\underline{L\frac{1}{2}} \text{ “ “ } 16.57061 = L16:11:5}$$

Example 14.—Required the value of the same annuity when payable quarterly.

Val. of an. of £1 in 100 intervals, at $\frac{7}{8}$ p. c. 66.46268 p. 39.

$$\text{“ “ } \underline{\underline{L\frac{1}{4}} \text{ “ “ } 16.61567 = L16:12:4}$$

The value of this annuity, payable yearly, is $16\cdot48152 =$
 $\text{£}16:9:8$, p. 50. It is in consequence of the progression of
 the tabulated rates by intervals of $\frac{1}{2}$ per cent. that we are able
 to solve such questions as the last, in which the annual rate
 involves an odd $\frac{1}{2}$ per cent.

II.—OF THE TABLES OF AMOUNTS.

The amount, at a specified rate of $\text{£}1$, in a specified number of years, is the sum to which $\text{£}1$, improved at the specified rate, will have accumulated at the end of the term. Thus $\text{£}1$, improved for 20 years at 3 per cent., will, at the end of that term, amount to $1\cdot80611$ (p. 10*) or, $\text{£}1:16:1\frac{1}{2}$; and $\text{£}100$ will in the same time amount to $180\cdot611$, or $\text{£}180:12:3$.

It can be easily shown, that corresponding terms in the series of Present Values and Amounts are reciprocals to each other. Thus (p. 10) we learn that at 3 per cent. $.55368$ increases in 20 years to $\text{£}1$, and (p. 10*) we learn that in the same time, and at the same rate, $\text{£}1$ increases to $1\cdot8061$. We have consequently two equal ratios, which form the following proportion :—

$$.55368 : 1 :: 1 : 1\cdot8061.$$

Whence, the product of the extreme terms in a proportion being equal to that of the mean terms, we ought to have,

$$.55368 \times 1\cdot8061 = 1;$$

and this on trial will be found to be true.

* Owing to an inadvertence the Tables of AMOUNTS have the same paging as the Tables of PRESENT VALUES. For distinction, references to the pages of the Tables first named will be marked with asterisks.

It is frequently useful to remember that this relation subsists.

The Amount of an annuity of £1, at a specified rate, in a specified number of years, is the aggregate of the amounts of the several payments, when improved at the specified rate, each from the date of its maturity to the end of the term.

A little consideration serves to show the relation that subsists between the Present Value and the Amount of an annuity when the rate and the term are the same. The former is the value *when the annuity is entered upon*, and the latter is the value *when the last payment has just been made*. We shall therefore be able to pass from the first of these values to the second, by multiplying the first by the amount of £1 during the term. Thus :—

Present Value of ann. for 40 yrs., at $3\frac{1}{2}$ p. c. 21·35507 p. 50.
Amount of £1 in 40 years, at $3\frac{1}{2}$ per cent. 395926 p. 12*.

Product 84·55027 = £84 : 11

And this is the amount of an annuity in 40 years, at $3\frac{1}{2}$ per cent., as will be found on reference to p. 50*.

The problems that admit of solution by aid of the tables of Amounts, do not seem to need special illustration.

It is in the inverse use of the tables, when the rate of interest realized in a transaction has to be determined, that the advantage of the number of the rates here given, with their closeness to each other, will be recognized and appreciated. In the case of an annuity in particular, when the purchase price and the term are known, it is no easy matter to determine the *exact* rate of interest involved. By the use

of the present tables this determination can always be effected by inspection, subject to an error of not more than one-sixteenth per cent.* Two examples will suffice to illustrate this.

Example 15.—A reversion of £220, due in 15 years, is purchased for £100. Required the rate of interest realized.

Dividing the purchase-money by the reversion, we have $\frac{100}{220} = .45455$ for the cost of each pound of the latter; and referring to the table of Present Values, in line with 15 years, we find (pp. 18-20) that this corresponds to a rate between $5\frac{1}{2}$ and $5\frac{1}{4}$ per cent., but nearer to the former of these rates.*

Example 16.—An annuity of £47. 17s. 6d. for 10 years is purchased for £380. What is the rate of interest realized?

Dividing the purchase-money by the annuity, we find $\frac{380}{47.875} = 7.93734$ for the cost of each pound of the annuity. And this we find (pp. 52, 54) to correspond to a rate lying between $4\frac{1}{2}$ and $4\frac{1}{4}$ per cent., but nearer to the former than the latter.

The tables of the Present Value of £1 were constructed by the aid of logarithms. The logarithms of the several columns, to ten places, were formed by a continuous process, affording the means of complete verification; and the corresponding numbers were taken out to seven places,

* This is only approximately true. The rates involved are not, as is here implied, strictly in the same ratio as the annuity values.

by the use of Sang's* table. The alternate columns were verified by comparison with Rance, and the remainder by construction in duplicate.

The tables of the Present Value of £1 per Annum were formed by continuous summation of the terms in the corresponding columns in the tables of the Present Value of £1—a process which permits of verification at as many points as may be necessary; and the terminal values in all the columns were finally verified by the application of the formula which expresses the value of an annuity of £1 in terms of the corresponding present value of £1. The whole of the values in both sets of tables were then cut down to five decimal places, making, where necessary, the usual correction in the last place retained.

The Tables of the Amount of £1 were constructed by multiplication, the calculations being carried out to ten places of decimals in all cases, except a few of the lowest rates of interest for which eight or nine were deemed sufficient to secure accuracy in the five decimal places retained.

Gray's Table for finding Logarithms and Anti-Logarithms to twelve places, afforded a simple and expeditious means of verifying the final values. So easy did this process of verification prove, that the Author was tempted to doubly test these values, first by finding the logarithm corresponding to the results obtained by multiplication, and then by

* The table employed for this part of the work is named on account of its superiority to the generality of seven-figure tables in regard to facility in use, and accuracy; arising, the former from the greater extent of the table, and the latter from the peculiar arrangement of the proportional parts.

inverting the process. Such is the power of this Table, and the facility with which it is used, that the whole operation of checking these 150 values was an easy task.

For illustration, the verification of the Amount of £1 in 100 years at $7\frac{1}{2}$ per cent. is subjoined :—

Log. (1.07625) ¹⁰⁰	=	3.191316446171	553
		191171455729	
		—————	
		144990442	333
		144595989	
		—————	
		394453	908
		394339	
		—————	
		114	262
I		908267	553
		454131	
		45413	
		2725	
		—————	
		1553001410531	333
		465900423	
		46590042	
		4659004	
		—————	
		1553518560000	Amount required.

The result arrived at in the computation differed from the above by 23 in the eighth and ninth decimal places.

The tables of the amount of £1 per annum were formed by the summation of the amounts of £1, and the final values were verified by the formula $\frac{(1+i)^n - 1}{i}$.

The whole of the tables under 6 per cent., and half of

those above that rate, were verified by comparison with Violeine, and the remainder by construction in duplicate.

Great care has been exercised in the examination of the proofs, which have been read three times with the original calculations. Comparison also has been made, as far as practicable, with Rance's and Violeine's tables. It is hoped that, as a consequence of the care thus bestowed, the present tables may be used with confidence.
