Although many Treatises on Arithmetic are already before the public, they are, for the most part, open to this objection, that they seek rather to invent labor for the student, by multiplying rules and examples, than to economise it by the most concise methods. The present work, which is not intended exclusively for a school book, nor yet to supersede the more useful of the elementary works already published, will, it is confidently believed, afford advantages to the accountant, merchant, and private student, which are not to be found in any other.

It is said, "that railways have been used in this country for more than two centuries:" the recent and rapid extension of the system is a proof that the practical application and improvement of well-known arts is often of more value than an absolutely new invention. In like manner, the simplest form of fractional arithmetic, that of decimals, though so ancient, and to the present day so universal a branch of school-boy lore, has so unaccountably fallen into disuse as to be all but forgotten in after years.

Another powerful motive for increasing in the public mind an interest in this mode of calculation is, that we thereby diffuse a knowledge of the great commercial benefits to be derived from an universal decimal scale of money, weights, and measures. Thus, we may ultimately obtain some parliamentary enactment which may rescue this country from the disgrace of being behind some other nations in the practical application of general principles.

By giving only one or two examples, as a formula for each kind of calculation, we are enabled so to extend the work as to include Compound Interest, Annuities, Life Assurance, and almost every computation that comes within the sphere of ordinary arithmetic; thus comprising in one small volume, of which the tables alone are worth the cost, what has hitherto been diffused through many large and elaborate works, at a proportionally large expense.

Every calculation in this work is reduced or reducible to one form—that of a simple equation; it has been the aim of the writer so to elucidate this method, that the accountant shall find no difficulty in applying the principle to any question whatever, though its formula be not found in these pages. By means of the decimal tables alone, which have never before been published at a moderate price, a vast amount of labor may be saved. All fractions of English money and time are already reduced to decimals in Tables I. and II., to which is added a new table of the decimals of the hundredweight, and the usual tabular values of compound interest and annuities at various rates per cent. The facilities of the decimal system may thus, in some degree, be anticipated.

These advantages, together with that of reducing the innumerable rules of common arithmetic to the simple form of an equation (without assuming the merit of a new discovery), form, at least, an unique combination, affording all the facilities that could reasonably be expected, even from a new calculus, applicable to the ordinary purposes of commercial and scientific investigation.

The great extension of prudential assurance against death and the various contingencies of life, which has recently taken place, renders a knowledge of this philanthropic subject almost a necessary part of a liberal education. It is, moreover, desirable to prepare the public mind for the discussion of the great question of financial reform, forced upon

us by the necessities of the times; this can be accomplished only by popular treatises on the higher branches of calculation, of which it is hoped the present work will prove neither the last nor the best.

It is disgraceful to our boasted civilization, that pauperism and destitution should be the lot of any but the incorrigibly vicious and criminal; for it is well known to those accustomed to the calculation of annuities, that the poor rates might be entirely extinguished by an extension of its principles to the labouring classes.\*

The profitable employment of the masses is now an European question. Though, on the Continent, the attempts to realize it may assume the distorted forms of "socialism" or communism, in themselves impracticable, it requires little sagacity to predict that the true solution of the problem, the universal scheme of co-operative labor and economy of capital, must ultimately be founded on principles developed from those of life assurance and annuities.

The unprecedented success of the Industrial Exhibition of 1851 is a striking illustration of the wonderful effects of cooperative labor, or capital, which is the result of labor, when judiciously applied to a useful end.

The art of arithmetic and the art of war, are, unfortunately, very closely connected. When money has been demanded for the purpose of destroying our fellow men, under the plea of avenging national honor, restoring the balance of power, natural enemies, or any vulgar delusion of the day, there has hitherto been little difficulty in raising loans to any required amount, to be repaid in any way, or in no way, as posterity might think proper. There can be no greater proof than this of financial ignorance, equalled only by moral imbecility; for a mere tithe of those enormous sums, which have been utterly wasted by an art which belongs to barbarous ages,

<sup>\*</sup> See "Arithmetic of Annuities," by Edward Baylis.

would have been sufficient, if applied in productive industry, to extinguish all the pauperism in Europe.

"——— dehinc absistere bello,
Oppida cœperunt munire, et ponere leges."—Hor. Sat.

The writer, having had some experience in the business of a Life Assurance Office, has been careful to select the most useful formulæ for all calculations that usually occur in this department. These are adapted to the Northampton Table of Mortality, a copy of which is included in the work, but are of course equally applicable to any other.

W. H.

#### DECIMALS.

1°. The great advantage of the decimal notation is so obvious, that it is surprising this mode of division is not universally adopted for all measures of quantity, whether weight, time, or space. The inconvenience of a gradual transition to the new method would be scarcely felt; for a decimal coinage might be established, so far as regards money of account, by merely dividing the pound sterling into 1000 farthings instead of 960, as at present.

In the meantime the accountant is recommended to use the accompanying table, which contains the decimals for every farthing in the pound, in all calculations in which

money fractions occur.

A brief outline of the principal operations in decimal arithmetic will be sufficient to illustrate its use; there are many popular treatises which contain full information on this branch of the science.

In expressing any number which has been counted, by a series of figures, as, two hundred and fifty-three (253), we use what is called the decimal scale of notation; for it is conventionally determined that the first figure on the right hand shall represent units, the second tens, the third hundreds, the fourth thousands, &c.; each digit acquiring a local value according to its position, by the following law—" Each figure shall increase tenfold in value with every remove toward the left." Thus we express whole numbers; but by an extension of the system, it is found that fractions, or parts of unity, may be expressed on the same scale, provided they be any multiple of ten, by determining that each digit shall diminish in value tenfold with every remove toward the right. A dot, called "the decimal point," is inserted to determine where whole numbers end and fractions begin.

If we wish to figure in decimals the expression, two hundred and fifty-three and one-half, instead of dividing unity into two parts and taking one, we divide it into ten equal parts and take five of them; but instead of writing  $253\frac{1}{16}$ , 253.5 will be sufficient; for we have determined that the denominator of the first fraction shall be one-tenth of the unit on its left, the second one-hundredth, the third one-thousandth, &c., i.e., every successive digit shall be the tenth part or parts of that on its left.

The nominator of a fraction notes how many of the parts into which unity is divided shall be taken, and the denominator the number of those parts. The expression: "divide unity into three equal parts and take two of them," is thus figured, § (two-thirds), in which 2 is termed the nominator, and 3 the denominator. If we purpose to use tenths of unity instead of thirds, we reduce what is called the "vulgar fraction" to a decimal; the question is, How many tenths in two-thirds of one? By a rule hereafter to be explained the equation is thus stated:

$$\left. \begin{array}{c} \mathbf{z} \\ \mathbf{1} \end{array} \right\} = \left\{ \begin{array}{c} 10 \\ \frac{2}{3} \end{array} \right\},$$

in which ten units are to be counted by two-thirds.

It is obvious that ten times as many parts as 2 must be taken out of the 3;

$$\frac{2}{3} \times 10 = \frac{20}{3},$$
which is  $\frac{6}{10}$  and  $\frac{2}{3}$  over;

and so on,

$$\frac{6}{10} + \frac{6}{100} + \frac{6}{1000} + \frac{6}{10,000} + &c.$$

ad infinitum; proving that although we can never reduce the fraction  $\frac{2}{3}$  to an exactly equal decimal, we can find a decimal as near the value as we please; for instance, the

above .6666, which is less than  $\frac{2}{3}$  by not so much as  $\frac{1}{10,000}$ th

part of unity. Thus, either entirely, or except a difference infinitely small, all fractions may be reduced to decimals.

2°. The terms, "addition," "subtraction," "multiplication," and "division," are sufficiently precise for the ordinary operations of arithmetic when confined to whole numbers; but when we apply the simple rules designated by these names to the higher relations of number and quantity, the terms prove inadequate, and are liable to confuse the mind. Before commencing these operations on fractional, but especially on positive and negative quantities, it would be well for the student either to extend his notions of their meaning, or to substitute more general and accurate expressions.

Thus, instead of add such and such quantities, we should rather say collect them; the process does not necessarily involve the idea of increase. Neither does subtraction always imply diminution; for if we subtract a debt from any one who owes it, we leave him a gainer by the amount of that debt. Multiplication is the counting one number by another; i.e., taking that number as many times, or parts of times, as there are units or parts of units in the other. The result, therefore, is increase or diminution, according to the nature of the terms. Division is the measuring one quantity by another, which may be done, whether the divisor be greater or less than the dividend.

Decimals are added and subtracted in the same manner as whole numbers; taking care so to place the decimal points that they may fall under one another, as in the following examples:—

58.034	69.368
·51	58.653
2.361	
100.1	10.715
161.005	

<sup>3°.</sup> In multiplying decimals, proceed as in whole numbers; but point off from the quotient as many decimal places as

are contained in the multiplier and multiplicand together When a limited number only of decimal places are required, the process may be abbreviated, by what is called the "contracted method." The *order* in which any number or quantity is counted by any other number or quantity, does not affect the result, therefore, which could come on

affect the result, therefore. W. libtool.com.cn

Invert the multiplier, proceed as before with the unit's digit, and cut off one figure from the right of the multiplicand, with every successive digit, remembering to carry the tens from the omitted figures. Place a dot over each omitted figure except the last. In order to find the place of the decimal point in the quotient, add as many ciphers, or dots, to the right of the quotient as there are dots in the multiplicand, and point off as before.

613·2 × ·35 ·35	487·8561 × 23·46 64·32
30660	8757122
18396	1313568 175142
214.620	26271
	10272-104 · · ·

4°. The common rule for the division of decimals is—
"Make the divisor an integer by removing the decimal point to the end of it; remove, likewise, the decimal point in the dividend an equal number of places toward the right hand; supply any deficiency with ciphers on the right; then divide, as in whole numbers, and the integers in the dividend, thus altered, will give the integral part of the quotient; the decimal figures, if any, remaining in the dividend will give the same number of decimals in the quotient. Equalize the decimal places in the quotient, if necessary, by ciphers on the left."

It is sometimes useful to find the place of the decimal point before division. There are several methods of doing this; but perhaps the readiest is that of comparing the characteristics. This mode is the more desirable since a knowledge of it is indispensable in using logarithms. The principle will be explained in paragraph 6°.

#### LOGARITHMS.

5°. If we multiply any number, as (x), by itself, the product is called the *square* of x, and is thus algebraically expressed,  $x^2$ , in which 2 is called the *exponent* of the number represented by x. The exponent 2 denotes x multiplied once by itself, which also is termed the *second* power of x;  $x^3$  is the cube or third power,  $x^4$  the fourth power, &c. The student is here cautioned against falling into the common error of beginners; namely, that  $x \times n$  times by itself is the *n*th power of x. Observe,  $x \times x = x^2$ , which is the *second*, that is the x + 1th power of x, therefore x + 1times by itself is the x + 1th power of x, or  $x^{n+1}$ .

Now, if  $x^{l+1}$  be the second power of x, the first power, if such a term be allowed, must be  $x^{l-1}$ , which is  $x^0$ . We shall

hereafter find that  $x^0$  signifies  $\frac{x}{x}$ , which equals unity, what-

ever number x may represent. This symbol,  $x^0$ , we may take as the zero point or unit of a table, which shall contain the powers of x, say to the 100th power. The symbols  $x^0$ ,  $x^2$ ,  $x^3$ ,  $x^4$ , &c., might be arranged in one column, and opposite the numbers produced by these powers. Or rather, let us write in one column the numbers 1, 2, 3, &c., as far as we please, and opposite the powers of x which produce or come the nearest to these numbers. This would constitute a table of logarithms, of which x, whatever number it be, is called the base. This base does not appear in the table; but instead, the number represented by its exponent, namely, the logarithm.

In the published tables the number ten is usually selected as the base; in those of Babbage, for instance, which are the most convenient for the actuary and accountant, and which contain the logarithms of all numbers from 1 to 108,000, with ample directions for their use. These direc-

tions state, that to multiply one number by another, we are to add their respective logarithms; thus  $x^2 \times x^3 = x^5$ , the number opposite the logarithm represented by 5 will be the product. On the same principle, to divide one number by another, subtract the logarithm of the divisor from that of the dividend. We can now more fully explain the symbol,  $x^3$ , the commencement of the system. Since  $x^4$ , divided by  $x^2 = x^{4-2}$ , or  $x^2$ ;  $x^2 \div x^2 = x^{2-2}$ , or  $x^3$ . Let 5 be the number corresponding with the logarithm of which 2 is the

exponent; then  $\frac{5}{5} = 1$ , the log of which is 0. We thus

arrive at the conclusion above-mentioned, that, whatever

number the base may be, the log of 1 = 0.

Let us take 10 as the base of the system; what, then, is the log of 2? Now, there is no power of 10, whole or fractional, which, multiplied by itself, will produce 2; but a fraction may be found which will come sufficiently near to the

6°. The log of 2, and, indeed, the logs of all numbers less than 10, must needs be fractional; what is termed the characteristic of such numbers is therefore a cipher prefixed to the log, thus 0.3010300, denoting that the number contains no figure in the ten's place. Accordingly, in the log of 10, the characteristic becomes 1, as 1.0000000; if the number consist of three figures it will be 2; and so on, always one less than the number of integral digits in the sum. The fractional part of the log is termed the mantissa.

But we require logs of numbers less than unity, as the fraction 142, in which a digit is wanting in the unit's place. This deficiency is expressed by the negative characteristic,  $\overline{1}$ , which is read (minus one) thus,  $\overline{1}$ .1522883. Again, the decimal fraction, 042, which is minus units, minus tenths, having no significant figure in either place, takes the characteristic  $\overline{2}$ , and so on, the negative characteristic being always one more than the number of ciphers prefixed to the decimal,

as in the following table:

295.75	characteristic	c=2
8.45	,,	0
7202.93	<b>31</b>	8
·8 <b>3</b>	,,	ī
.03		$\overline{2}$
V.00	<sub>083</sub> libtool.c	comzn
182.6	"	2

It is difficult for those unaccustomed to mathematical reasoning, to come at a clear conception of the relative values of positive and negative expressions; but the idea once acquired, problems containing these symbols are not by such complication the more difficult. Consider positive numbers as representing gains or possession, and negative as debts or losses. If a person possess £1, the unit is positive; if he lose it, we substitute a cipher to represent his financial condition. Here is no possession and no debt; but if in addition to losing £1 he should owe another, the cipher must be replaced by  $\overline{1}$ , the initial of a negative series of figures. he possess £1, and at the same time owe £1, but his creditor should choose to cancel the obligation, we deduct the negative from the positive quantity  $(1 - \overline{1})$ . Now, to take away a loss is the same as to add an equivalent gain; therefore, change the sign of the negative quantity, and the equation becomes (1 + 1) = 2.

If a man have debts owing to one party amounting to £4 i.s.,  $\overline{4}$ , and at the same time another creditor absolve him from obligations to the amount of £11, we have the equation  $\overline{4} - \overline{11} = 7$ ; for the removal of the obligation to pay £11, when before he owed £15, leaves him a gainer to the amount of £7. The following equations will fully elucidate the principle:—

The rule then is—"To find the characteristic of the quotient, subtract the characteristic of the divisor from that of the dividend, carrying plus one before subtracting, if the first two significant figures of the divisor be greater than those of the dividend."

Thus,

$$146.08 \div 00279 = \text{characteristic 2} - \overline{3};$$

carry one, for 27 is greater than 14, and it becomes  $2-\overline{2}=4$ . The quotient must therefore have five integers before the decimal point.

$$\frac{295.75}{8.45} = 2 - 0,$$

carry one, for 84 is greater than 29, i.e., 2-1=1.

$$\frac{2}{.008} \left\{ 0 - \overline{3} = 2; \quad \frac{7202.93}{.14} \right\} 3 - \overline{1} = 4.$$

#### THE CHAIN RULE.

7°. A method of stating and working arithmetical questions is much used on the Continent, which supersedes the great variety of rules usually taught in our schools. Almost every calculation that comes within the sphere of an accountant's business may, by its aid, be reduced to the form of a simple equation, and worked with great facility. Let us investigate the principles on which this method is founded.

Arithmetical calculation consists of the process of reasoning applied to questions in which numbers represent the relations of quantity. All who reason at all, whether learned or unlearned, can do so by only one and the same process. This process, in its various forms, is described by Aristotle and the logicians of his school, under the name of the syllogism. It is possible, however, that a more simple and general representation of the rational functions may yet be established, the result of clearer conceptions and a more profound analysis. Logic is not indeed an invention, as some imagine, neither is its instrumentality mainly serviceable for the discovery of truth, but error. It teaches how to avoid the various deceptions of the senses which tend to

pervert our intuitions, and to extricate a proposition from all ambiguity of expression or sophistical artifice.

So also in mathematics, we endeavour to divest a problem of all considerations not essential to its solution, and to show the intimate connection of the discoveries or speculations of science with the most obvious and familiar facts.

By way of illustration, let us take the following sentence, which in logic is called a proposition—"Every creature possessed of reason and liberty is accountable for his actions." Here we have an equation, the terms on one side being, creature, reason, liberty; and on the other the term accountability. As the two sides evidently balance each other, it may be compared to an equation involving unity, a = a, in which, if one side be measured or divided by the other, the result is  $\frac{a}{a} = 1$ . A series of three propositions having a mutual

dependence is called an argument, or syllogism, thus:—
"Every creature possessed of reason and liberty is ac-

countable for his actions.

"Man is a creature possessed of reason and liberty. "Therefore, man is accountable for his actions."

Illustrating the maxim - "What can be predicated of

the whole can be predicated of every part."

The syllogism is evidently a series of equations, the terms of which, had they consisted of numbers, and numbers always represent things, might have been arranged in two columns, putting any symbol as x, in the place of the question, whether man be accountable? or the conclusion which the argument is intended to verify.

$$\left. egin{array}{c} x \\ reason \\ creature \\ liberty \end{array} \right\} = \left\{ egin{array}{c} accountability \\ creature \\ man \\ accountability. \end{array} \right.$$

If the above series were composed of numbers, we should multiply, i. e., count the terms on the right and left respectively with each other, and then measure the product of the right column by that of the left, by which its agreement or disagreement with unity would be apparent.

Considered as a syllogism, the process is analogous; namely, compare the terms, observing at every step their connection and agreement with the middle term. See on which side

the balance preponderates, or whether the two sides neutralize each other, in which case the answer may be compared to unity. If the left column preponderate, the result may be represented numerically by a fraction  $\frac{a}{b}$ , of which the de-

nominator b is greater than the nominator a ...

These principles lead to the following general rule, which

is applicable to all arithmetical questions:-

#### BULE.

Collect the terms by addition or subtraction, if necessary, and arrange them in two columns, commencing the left column with a symbol, say the letter x, of the result wanted, and place under it all the known or supposed terms. Commence the right column with a term equivalent to x, of the kind in which the answer is required. Under it place the unknown terms, opposite to similar terms on the left, and let the last term on the right column be of the kind in which the answer is required. Multiply all the terms in each column respectively by each other, divide the product of the right column by that of the left, the quotient will be the answer.

The only difficulty lies in the correct or logical statement of the terms, which a little practice with questions in various rules of arithmetic will soon enable the student to surmount.

The process admits of much abbreviation where vulgar fractions occur, by transposing the denominators to the opposite side, cancelling such numbers on each side of the equation as can be measured by a common divisor, and other expedients, which a very limited acquaintance with fractional arithmetic and the theory of equations will supply.

#### SIMPLE INTEREST.

8°. Simple Interest, or the amount paid for the use of a sum of money during the whole term of the loan, is easily computed when the principal, time, and rate per cent. consist of whole numbers. Thus, £100 for one year, at 5 per cent., amounts to £105. The interest of £100 for three years is 5+5+5; this added to the principal £100, amounts to £115.

Cases, however, occur, in which one or more terms in the calculation consist of fractions, as when a sum composed of pounds, shillings, and pence, is lent at interest for a given number of days, not being an aliquot part of a year. The readiest way of computing such questions is, by reducing the several terms to the decimal parts of a year and of a pound. This is already done in tables I and II., which contain respectively the decimals corresponding to every farthing in the pound, and to every day in the year. By the use of these tables, questions of interest may be calculated with a facility second only to that obtained by the use of the published interest tables, by merely counting the decimals corresponding to the given number of days, by those of the interest per pound. This gives the amount of interest for the given time, which, added to unity, and counted by the given sum, gives the whole amount of principal and interest for the given time. By using the interest of £1 instead of that of £100, the divisor is reduced to unity, and the operation thereby abbreviated.

£3, interest of £100 = 
$$\frac{3}{100}$$
, or ·03 of £1.  
£3 $\frac{1}{2}$ , , , ,  $\frac{3\frac{1}{2}}{100}$ , or ·035 of £1.  
£4, , , ,  $\frac{4}{100}$ , or ·04 of £1.  
£5, , , , ,  $\frac{5}{100}$ , or ·05 of £1.

#### Examples.

What is the interest and amount of £100, in five years, at 5 per cent. per annum, simple interest?

#### Statement.

What interest of one
If one hundred pounds in one year give instead of one year, five

one hundred pounds? five pounds, five years;

TABLE II.

Decimals corresponding with every Day in the Year.

$$\begin{pmatrix}
x \\
100 \\
1
\end{pmatrix} = \begin{pmatrix}
100 \\
5 \\
5
\end{pmatrix} = £25 + £100 = £125.$$

#### w Operation ol. com.cn

Cancelling 100 on each side of the equation, 5 + 5 = 25, which, added to 100 equals 125, the whole amount.

What is the amount of £100 in five years, if £150 produce £6 interest in one year?

$$\begin{bmatrix} x \\ 150 \\ 1 \end{bmatrix} = \begin{bmatrix} 100 \\ 6 \\ 5 \end{bmatrix} = £20 + £100 = £120$$

#### Proof.

What principal will produce  $= \left\{ \begin{array}{c} 20 \text{ interest} \\ 150 \text{ principal?} \end{array} \right\} = £100.$ 

What is the amount of £537.625, for five years, at 4 per cent. per annum?

$$\left\{\begin{array}{c} x \\ 1 \\ 1 \\ \text{yr.} \end{array}\right\} = \left\{\begin{array}{c} 537.625 \\ 04 \\ 5 \\ \text{yrs.} \end{array}\right.$$

$$\underbrace{\begin{array}{c} 2107.525 \\ 537.625 \end{array}}_{\text{Principal.}} \text{Interest.}$$

$$\underbrace{\begin{array}{c} 645.15 \\ 645.15 \end{array}}_{\text{Amount.}} \text{Amount.}$$

By collecting the terms,  $(.04 \times 5) + 1 = 1.2$ , the amount of £1 in one year, the question might be stated thus:—

$$\left\{ \begin{array}{c} x \\ 1 \end{array} \right\} \qquad \left\{ \begin{array}{c} 537.625 \\ 1.2 \end{array} \right\} = 645.15, \text{ or £645 } 3s.$$

#### Proof.

Interest of £1 in five years =  $(.04 \times 5)$  or .2;

$$\begin{array}{c} \cdot \cdot \begin{array}{c} x \\ 2 \end{array} \right\} \qquad \left\{ \begin{array}{c} 107 \cdot 525 \text{ Interest.} \\ 1 \end{array} \right.$$

537.625 Principal.

If a term occurs of a higher or lower denomination than that in which the answer is required, another connecting term will be necessary.

What is the interest and amount of £300, in four years, at

fifty shillings per cent. per annum?

$$\begin{array}{c} \mathbf{x} \\ \mathbf{\pounds}100 \\ 1 \text{ yr.} \\ \mathbf{\pounds}1 \end{array} \right\} = \left\{ \begin{array}{c} \mathbf{x} \\ \mathbf{\pounds}300 \\ \mathbf{50s.} \\ 4 \text{ yrs.} \end{array} \right\} = \left\{ \begin{array}{c} \mathbf{x} \\ \mathbf{\pounds}300 \\ \mathbf{50s.} \\ 4 \text{ yrs.} \end{array} \right\} = 30 + \mathbf{\pounds}300 = \mathbf{\pounds}330.$$

Proof.

Interest in 4 yrs. of 
$$200s$$
.  $\begin{cases} x \\ 200s \end{cases}$   $\begin{cases} 30 \\ £100 \\ 20s \end{cases}$  = £300.

#### Operation.

Cancelling the ciphers on each side, we have,

$$\frac{3 \times 5 \times 4 \times 1}{1 \times 2} = \frac{60}{2} = £30 + £300 = £330 \text{ Amount.}$$

What is the interest on £6, for twenty days, at 5 per cent. per annum?

Select from Table II, the decimal of a year corresponding to twenty days, and state as before.

$$\begin{array}{c}
x \\ £1 \\ 1 \text{ yr.}
\end{array} \right\} = \left\{ \begin{array}{c} £6 \\ .05 \\ .05479 \end{array} \right\} .16438, \text{ or } 3s. \, 3\frac{1}{4}d.$$

Proof.

$$\begin{pmatrix} x \\ \cdot 05 \\ \cdot 05479 \end{pmatrix} = \left\{ \begin{array}{c} \cdot 16438 \\ \pounds 1 \\ 1 \text{ yr.} \end{array} \right\} = \pounds 6.$$

9°. When the *principal* is the question, the sum, time, and rate per cent. being given, the proportion is inverse, i. e., the middle term is in inverse ratio to the first.

B returns A £645 3s., principal and interest for the loan of a sum for five years, at 4 per cent.; what was the sum advanced?

#### Statement.

What principal in five years will amount to 645.15, if £1 in five years amount to 1.2?

The question concerns the principal, which involves the element of time; the more interest £1 produces in five years, the less principal will be required to produce the sum £645·15. The sum must be measured by what £1 will produce in five years. The above statement is therefore incorrect. It should stand thus:—

What principal in five years will amount to £645.15, if the amount 1.2 be produced in five years by £1? •

$$\left\{ \begin{array}{c} x \\ 1 \cdot 2 \end{array} \right\} = \left\{ \begin{array}{c} 645 \cdot 15 \\ 1 \end{array} \right\} = £537 \cdot 625.$$

10°. In how many years will £537 12s. 6d. amount to £645 3s., at 4 per cent., simple interest?

Since the amount equals principal + interest, the amount minus the principal will give the interest for the whole term.

645.15 Amount. 537.625 Principal.

#### 107.525 Interest.

The question now is, in how many years will £537.625 produce £107.525 interest, if in one year .04 interest is produced by £1. The larger the capital, the fewer the years to produce the given amount; the interest must therefore be measured by the capital.

$$537.625 \atop .04 = \begin{cases} 107.525 \\ £1 \end{cases} = \frac{107.525}{537.625 \times .04}$$
$$= \frac{107.525}{21.505} = 5 \text{ years.}$$

At what rate per cent. will £537 12s. 6d. amount to £645 3s. in five years?

The amount of interest is £107.525

What rate per pound, if £537.625 in five years produce £107.525 interest?

$$\begin{cases}
 25 \\
 5 \text{ yrs.}
 \end{cases} = 
 \begin{cases}
 \frac{£1}{107.525} \\
 1 \text{ yr.}
 \end{cases} = 
 \frac{107.525}{2688.125} = .04.$$

11°. When logarithms are used, it may be convenient to take the rate per cent. instead of the rate per pound, according to the following rule; virtually, the process is the same.

To find the amount of interest on a sum of money at any given time. Add together the logs of the principal, the rate, and the time, and subtract 2 from the characteristic of the resulting logarithm, which, since it removes the decimal point two places toward the left, is the same as dividing by 100.

What is the interest on £537 12s. 6d., in five years, at 4 per cent?

$$\begin{vmatrix}
x \\
100 \\
1 \text{ yr.}
\end{vmatrix} = \begin{cases}
537.625 = \log 2.7304795 \\
4 = \log 0.6020600 \\
5 \text{ yrs.} = \log 0.6989700
\end{cases}$$

$$\frac{4.0815095 \div 100}{2}$$

$$\frac{2}{2.0315095} = £107.525.$$

Required the interest on £325 fs. 4d., for seven years, six weeks, and three days, at £3 4s. 9d. per cent. per annum.

$$\begin{vmatrix}
x \\
100 \\
1 \text{ yr.}
\end{vmatrix} = \begin{cases}
325.3166 & = \log 2.5123062 \\
3.2875 & = \log 0.5102098 \\
7.1233 \text{ yrs.} & = \log 0.8526812
\end{cases}$$

$$\frac{3.8751972}{1.8751972} \div 100$$

or £75 0s. 51d.

12°. DISCOUNT is the allowance made for the payment of a sum of money before it becomes due. The sum paid after deducting the discount is called the present value.

What is the present value of £100, paid down now, instead of being paid at the end of one year, the rate of interest

being 5 per cent.?

The commercial rule is—Deduct for the discount the whole amount of interest on the sum till it becomes due. Thus, 100 - 5, or £95, would be the sum received as the present value of £100. But £95 in one year will produce at the same rate, only £4 15s. interest. The commercial discount is, consequently, considerably more than the present value, which is £95 4s. 84d.

It is usual for bankers to charge discount for three days more than the number of days the bill has to run; these are

called "days of grace."

Since discount is merely interest deducted in advance, the formulæ for interest apply equally to questions of discount.

What is the discount on a bill due sixty-nine days hence, for £250, at 4 per cent.?

#### Statement.

What discount on £250, if the discount per pound in one year be 04, how much in 1973 of a year?

$$\begin{bmatrix} x \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 250 \\ 04 \\ 1973 \end{bmatrix} = 1.978, \text{ or £1 19s. 5} \frac{1}{4}d.$$

The commercial discount, we have said, is simply the deduction of interest for the time that elapses till the sum becomes due, and is found by sum × interest × time. But the true discount is the difference between the sum due at the end of the term, and the present value, or the sum that would produce the amount at the same rate of interest during the term.

What is the true discount on a bill due sixty-nine days

hence, for £250, at 4 per cent.?

First find the present value, i. e., what sum will produce \$250 in seventy-two days, if '04 interest is produced in one year by £1, in '1973 of a year, what is the amount?

$$\begin{pmatrix} .04 \\ .1973 \end{pmatrix} + 1$$
  $\left\{ = \left\{ \begin{array}{c} 250 \\ 1 \end{array} \right\} = \frac{250}{1.0078} = £248.065,$ 

the sum that will produce £250 in seventy-two days.

250·000 248·065

1.935, or £1 18s.  $8\frac{1}{3}d$ . true discount.

£1 19 5½ Commercial discount.

1 18 8½ True discount.

8½ Excess.

What is the present value of £100, due two years hence, at 5 per cent. per annum?

#### Statement.

What sum in two years will produce £100, if in two years £110 is the amount of £100?

# GENERAL REMARKS ON DISCOUNTS AND PERCENTAGES.

13°. Suppose the cost of producing a parcel of goods be £75, and a profit of 25, i.e.,  $\frac{1}{4}$  per cent., be required. £25 is added to £75, and the goods are sold for £100; but £25 is only  $\frac{1}{4}$  of £75.

Therefore, to produce a profit of  $\frac{1}{4}$  per cent.,  $\frac{1}{3}$  of the nett value must be added. From this we obtain an universal rule for all fractions.

To take off 
$$\frac{1}{2}$$
,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ ,  $\frac{1}{20}$ ,  $\frac{1}{21}$ ,  $\frac{1}{22}$ ,  $\frac{1}{99}$ ,

Add . .  $\frac{1}{1}$ ,  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{19}$ ,  $\frac{1}{20}$ ,  $\frac{1}{21}$ ,  $\frac{1}{98}$ ,

i.e., to take off  $\frac{a}{12}$ , add  $\frac{a}{1211}$  on

From the above data we may also deduce another rule. For  $\frac{1}{2}$  deduction we add  $\frac{1}{4}$ ; now

$$\frac{1}{3} = \frac{1 \times 25}{3 \times 25} = \frac{25}{75}$$
, and  $\frac{25}{75 + 25} = \frac{25}{100}$ .

Therefore, to find how much must be added, to allow a given percentage from the gross price, take a fraction, the nominator being the required percentage, and the denominator 100 minus the nominator.

To take of 
$$\frac{5}{100}$$
,  $\frac{20}{100}$ ,  $\frac{25}{100}$ ,  $\frac{30}{100}$ ,  $\frac{35}{100}$ ,  $\frac{75}{100}$ ,  $\frac{95}{100}$  per cent.  
Add . .  $\frac{5}{95}$ ,  $\frac{20}{80}$ ,  $\frac{25}{15}$ ,  $\frac{30}{10}$ ,  $\frac{35}{65}$ ,  $\frac{75}{125}$ ,  $\frac{95}{5}$ ,

Or . . .  $\frac{1}{10}$ ,  $\frac{1}{4}$ ,  $\frac{1}{3}$ ,  $\frac{3}{7}$ ,  $\frac{7}{13}$ ,  $\frac{3}{1}$  or 3, 19.

i.e., to take off  $\frac{n}{100}$ , add  $\frac{n}{100-n}$ .

What must be added to the nett to allow 22½ per cent. from the gross?

Nett price 12s. 11d. Add 12s. 11d. 
$$\div \frac{22\frac{1}{2}}{77\frac{1}{2}} = \frac{45}{155} = \frac{9}{31}$$

and 12s. 11d.  $\times$  9  $\div$  31 = 3s. 9d. + 12s. 11d. = 16s. 8d. gross price.

A gives £100 for a parcel of goods, with a reduction of 20 per cent. discount, or £80 nett. B gives £100 for a similar parcel, with a reduction of 30 per cent., or £70 nett. For the same article A gives £80, B £70. The question is—How much cheaper does B buy than A? How much less is £70 than £80? It is by the larger sum that the difference must be measured; because you wish to know, how much per cent. the smaller sum is less than the larger one. Ten pounds, the difference, is ½ of £80; it is ½ less, and ½ of 100, \(\frac{100}{8}\), is 12½ per cent.

If, however, the question had been reversed and placed thus: How much dearer did A pay for his goods than B? In this case, it is with the *smaller* sum that the difference must be measured; you have to determine how much per cent. *more* £80 is than £70. (The difference, £10, is  $\frac{1}{7}$  of £70 and  $\frac{1}{7}$  of £100, or  $\frac{160}{7}$ , is  $14\frac{2}{7}$ , i.e.,  $14\frac{2}{7}$  per cent. *less*.

In this supposed transaction, therefore, B purchases his goods 12½ per cent. lower than A; but A paid 14½ per cent.

higher than B.

In numerous ways, in measuring the difference of sums, numbers, or quantities, by percentages, it is extremely important to bear this distinction clearly in mind. It makes all the difference whether we compare the larger with the smaller amount, or the smaller with the larger amount.

Suppose A and B hold railway stock; A paid £100 per share, and B had bought the same at £50 per share. The price that A paid was double of that which B paid, consequently 100 per cent. dearer. The price which B paid was 1 of that which A paid, therefore 50 per cent. cheaper.

There is another very common mistake into which traders fall with respect to discounts. A person finds by observation that the expenses of conducting his business form altogether 10 per cent. on his returns. He thinks himself entitled to 10 per cent. profit. The two together make 20 per cent. He adds \(\frac{1}{3}\), or 20 per cent., to the cost of every article. At the end of the year, supposing the estimate of his expenses to be right, what will be the profit on his returns? In the place of 10 per cent., as he expected, he will find it to be 6\(\frac{1}{3}\) per cent. Take an example:—

A person pays £100 for a parcel of goods. He adds  $\frac{1}{5}$ , or 20 per cent., and sells them for £120. His returns at the end of the year are made up in this way: The expenses of his business are equal to 10 per cent. on his returns. On this transaction 10 per cent. is £12, reducing the nett sum received to £108, or 8 per cent; which on £120, the amount

of his returns, is only 63 per cent.

## Example.

How much of £100 is £8 of £120? or, what percentage will £100 make if £120 make £8?

The greater the capital the less the percentage; therefore:

$${120}$$
 =  ${100 \atop 8}$  =  ${8 \times 10 \atop ww.libbool.com}$  or  ${80 \atop 12}$  =  $63$ .

In like manner, if a person return £30,000, having put on 20 per cent. on the cost of each article, the prime cost of the whole of his goods must have been 30,000 - 5000, or £25,000. Well, from £30,000 he has 10 per cent., or £3000, to deduct for charges, leaving his nett receipts £27,000, or £2000 above the first cost, which on £30,000, the amount of his returns, is a profit of 63 per cent.; while all the time he had expected, as his returns mounted up during the year, that 10 per cent. was clear profit. Thus, after having done business to the extent of £30,000, he is puzzled when his stock-taking shows his profits to be only £2000.

#### Illustrations.

14°. What profit, at £3 7s. 6d. per cent., is there on a capital of £2044 3s. 6d.?

$$\binom{x}{100} = {2044 \cdot 175 \atop 3 \cdot 375} 68 \cdot 9909$$
, or £68 19s. 9\frac{3}{4}d.

## Proof.

How much per cent., if the profit on £2044:175 be 68.9909?

$$\begin{bmatrix} x \\ 2044 \cdot 175 \end{bmatrix} = \begin{bmatrix} 100 \\ 68 \cdot 9908 \end{bmatrix} 3 \cdot 375, \text{ or £3 7s. 6d.}$$

What is the quarterly interest of £96 7s. 6d., at 4 per cent.?

## Proof.

What rate per pound, if 96.375 in 1 year produce .96375?

$$96.375 = \begin{cases} \frac{1}{1} & \text{btool.com.cn} \\ 96375 & \text{24.094} \end{cases} = .04.$$

The cost of producing an article is 28s. per cwt., which is sold at 38s. How much is that per cent.?

#### Statement.

How much of £100 is 10s. of £1 18s.? Or, What profit will £100 produce if £1 18s. produce 10s.?

$$\binom{x}{1\cdot9} = \binom{100}{\cdot5} = 26.8105$$
, or £26 6s.  $2\frac{1}{2}d$ . per cent.

If 8 cwt. 1 qr. 24 lbs. cost £26 4s. 5d., how much is that per cwt.?

1 qr. 24 lbs. = 52 lbs., which is 
$$\frac{52}{112}$$
, or .4643, ...

$$8.4643$$
 =  $\left\{\begin{array}{l} 1 \text{ cwt.} \\ 26.221 \end{array}\right\} 3.0978$ , or 61s.  $11\frac{1}{2}d$ . per cwt.

## ANNUITIES AT SIMPLE INTEREST.

15°. An annuity is any periodical income payable at equal

intervals; as yearly, half yearly, quarterly, &c.

Annuities to continue a fixed number of years are called "annuities certain;" those which are to be paid only so long as one or more individuals shall live, are called "contingent, or life annuities." An annuity to continue for ever is called a "perpetuity." When the first payment of an annuity is not to commence till the expiration of a given time, it is called a "reversionary, or deferred annuity."

## Example.

What annuity, payable yearly, may be purchased for £2360, at 4 per cent. simple interest?

$${x \choose 1} = {2360 \text{WW} | \frac{\text{libtool.com.cn}}{04} = 94.4, \text{ or £94.8s.}}$$

#### ANNUITIES FORBORNE.

16°. When the payment of an annuity has been forborne for a certain number of years, the sum of all the payments, together with the sum of the interest of each payment, from the period of its becoming due till the payment of the whole, will be the amount for the lapsed time.

Suppose an annuity of £20 per annum were forborne five years, the rate of interest being 5 per cent., i. e., £1 per annum for the £20, what is the amount due at the end of the

five years?

The last payment, being received at the time it falls due, is simply

£20.

The last payment but one, being due a year ago, is

20 + 1 (1 year's interest).

The last payment but two, being due two years ago, is

 $20 + 1 \times 2$  years' interest.

The last payment but three, being due three years ago, is

 $20 + 1 \times 3$  years' interest.

The last payment but four, being due four years ago, is

 $20 + 1 \times 4$  years' interest.

The last payment but four being the first payment of the annuity, and due at the end of the first year, has 5—1 year's interest due thereon. The amount, then, consists of a series of terms in arithmetical progression, whose common difference is one. It is therefore amenable to the following laws:

"Any term of an equidifferent or arithmetical series, is equal to the first term, increased by the common difference, multiplied by one less than the number of terms."

"The sum of the terms of an equidifferent series is equal to the sum of the first and last terms, multiplied by half the

number of terms."

First term £20 Last term 20 + 444 half the number of terms. 24 88 22 £110 spm of five terms.

As stated above, the sum of the terms contains the annuity, counted by the number of years, together with interest successively for the number of years less one. If we, then, multiply the number of years by the number of years less one, and count the interest by that product, which is nearly the square of the number of years, we get twice the interest of £1, or the interest of £2 for the whole term, which, divided by 2, gives the interest of £1 for the whole term; to this add £1, multiplied by the number of years for the whole amount of an annuity of £1 for the lapsed time, which must be counted by the given annuity.

Questions of this kind involve an infinite series, for the summation of which a general formula and explanation may be found in most of the works on algebra; to which the student is referred for a satisfactory demonstration. Meanwhile we deduce a general formula in accordance with our system, which, for all practical purposes, will prove sufficient.

#### Statement.

What interest on £1 per annum if £1 forbonne five years

equals 
$$\frac{5 \times 4 \times 95}{2}$$
,

$$\frac{x}{1} = \left\{ \frac{1}{5 \times 4 \times 05} \right\} = \frac{.5}{5 \cdot 5}$$
 amount of interest.

www.libtococom.cn

110.00 amount due at the end of five years.

17°. What is the amount of an annuity of £436 forborne twelve years, at  $3\frac{1}{2}$  per cent. simple interest?

## Operation. 12 11 132 035 660 396 2) 4.620 2.310 +12Amount of annuity of £1, forborne 12 years. Annuity (inverted). 634 57240 4293 858

6239 1, or £6239 3s. 21d.

If an annuity forborne twelve years, at  $3\frac{1}{2}$  per cent., amount to £6239·16, what was the annuity?

By last example, annuity of £1, forborne twelve years, amounts to £14.31.

$$\cdot \cdot {}_{14\cdot 31}$$
  $\times \underbrace{ [623916] }_{1}$   $\times \underbrace{ 2436}_{1}$ .

For the methods of finding the number of years and rate per cent. from the remaining data, see Jones's work on the "Value of Annuities."

## PRESENT VALUE OF ANNUITIES AT SIMPLE INTEREST.

18°. Annuities being usually calculated at compound interest, tables are constructed for finding the present value. The following is the process for annuities at simple interest.

What is the present value of £1 per annum for three

years, at 3 per cent.?

This question involves a series, for the summation of which no general formula has yet been discovered. The present value for any term of years may, however, be found, in accordance with our method, in a series of equations, adding together the results.

#### Statement.

What is the present value of £1 per annum if  $1 + (1 \times .03)$  is its amount in one year?

The reciprocal of any number is unity divided by that

Amount of £1 at Compound Interest, in any Number of Years not exceeding fifty.

exceeding inty.

number; therefore, to find the present value of £1 per annum for any number of years, we add together the reciprocals of the amounts at the end of each year. This product, counted by the given annuity, will be its present value for the given term of years. Com. Cn

#### COMPOUND INTEREST.

19°. When the interest of money is added to the principal, at periodical intervals, the interest accumulating on this increasing capital is called "compound interest."

The following series exhibits the law of increase when the

interest is payable yearly, on £100, at 5 per cent.

Amount at the end of the first year, 100 + 5.

,, ,, second year, 
$$100 + £10$$
 5s., third year,  $100 + £15$  15s. 3d.

Since 1 + .05 is the ratio, or amount of £1 with interest at the end of the first year, the amount of any other sum in one year will be in the same proportion; i. e., as 1 is to 1.05, so is any sum to its amount in one year. But 1.05 forms a new principal, the interest of which, with the principal, gives the amount of £1, the original principal, at the end of the second year; therefore,

$$1:1+.05::1+.05,$$

or, what is the amount in one year of 1 + .05, if £1 in one year produces 1 + .05?

The square of the ratio 1 + .05 is, then, the fourth term of the proportion:  $1:1 + .05::1 + .05:(1 + .05)^2$ , of the amount of £1 at the end of the second year.

To find the amount at the end of the third year, another

statement will be required:

And so en, to twenty or any number of years, making fresh equation for every step in the progression, until a

arrive at the last term; which, multiplied by the given sum, will give the whole amount of any sum in a given number of years. This method, too tedious for practical use, is much shortened by the aid of logarithms, according to the following

general rule:-

The amount of £1 vat compound interest, for any number of equal intervals, is its ratio, or amount with interest for the first interval, raised to the power indicated by the number of equal intervals. In twenty years, 1 + .05 amounts to  $.(1 + .05)^{20}$ , the twentieth power of 1 + .05. The log of 1.05, multiplied by 20, equals the log of the amount of £1 in 20 years. On this principle Table III. is constructed, which gives the amount of £1 at compound interest, at various rates per cent., from one to fifty years inclusive. We have only to select from this table the term opposite to the given number of years, and multiply it by the given amount.

Questions of which the data are not contained in this table may easily be solved by the aid of logarithms and the

decimal table.

The following table, which contains the logarithms of the ratios, or amount of £1 for the first term or interval, at various rates per cent., will be found useful in calculations of compound interest.

Rate of Interest.	Logarithm of Ratio.	Rate of Interest.	Logarithm of Ratio.
I I I I I I I I I I I I I I I I I I I	-0043214 -0053950 -0064660 -0075344 -0086022 -0096633 -0107239 -0117818 -0128372 -0138901 -0149403 -0159881 -0170333 -0180761 -0191163	556664 77778 8888 888 9	·0232525 ·0242804 ·0253059 ·0263289 ·0273496 ·0283679 ·0293838 ·0303973 ·0314085 ·0324173 ·0334238 ·0344279 ·0354297 ·0364293 ·0374265

## Examples.

20°. What is the amount of £325 6s. 4d. in seven years, six weeks, and three days, at £3 4s. 9d. per cent. compound interest, convertible yearly?

The above statement would give the amount at simple interest, but the question involves a series of equations. If we first find the amount for eight years, then for seven years, by raising the logs of the ratios respectively to the eighth and seventh powers, the difference of these two will give the amount added to the capital in the eighth year, which, counted by  $\frac{1233}{10,000}$  the of a year, the decimal, and added to the amount for seven years, will be the required answer. But the shortest method will be to multiply the log of the

the amount for seven years, will be the required answer. But the shortest method will be to multiply the log of the ratio by the time, and add to the sum the log of the principal, according to the following statement:—

$$\begin{array}{c}
x\\1\\1\text{ yr.}
\end{array} = \left\{ \begin{array}{c}
325 \cdot 3166\\(1 \cdot 03237)^{1}\\7 \cdot 1233
\end{array} \right\} =$$

log 0.013854

3321.7 multiplier inverted.

0.0985535 2.5123063 log of 325.3166

2.6108598 = 408.187, or £408 3s. 9d.

What is the amount by the table of £452 6s. in nine years, at 4 per cent. per annum, compound interest?

## Statement.

What is the amount in nine years of £452.3, if in nine years £1 amount to 1.4233?

$${x \atop 1}$$
 =  ${452.3 \atop 1.4233}$  = 643.7585, or £643 15s. 2d.

Required the amount of £452 6s., in nine years, at 4 per cent. compound interest, convertible half-yearly?

0.1548036 = 1.428247, amount of £1 in nine  $452.3 = \log 2.6554266$  years.

2.8102302 = 645.9964, or £645 19s. 11\flactdd.

## The Principal.

21°. What sum will amount to £432 in eight years, at 3 per cent. compound interest?

#### Statement.

What principal in eight years will amount to £432, if £1.2668 be produced in eight years by £1?

$$\begin{bmatrix} x \\ 1 \cdot 2668 \end{bmatrix} = \begin{bmatrix} 432 \\ 1 \end{bmatrix} = 341 \cdot 0167$$
, or £341 0s. 4d.

What sum will amount to £432 in eight years, at 3 per cent. compound interest, convertible quarterly?

$$\left(1 + \frac{03}{4}\right)^{8\times4} = (1 + .0075)^{32}, \text{ amount of £1 at 32 intervals,}$$

$$\left(1 \cdot .0075\right)^{1} \left\{ \begin{array}{c} 432 \\ 1 \\ 32 \text{ intervals for} \end{array} \right\} = 340 \cdot 1257, £340 2s. 6 \frac{1}{4}d.$$

The greater the number of intervals, the less the sum required to produce the given amount; the two last terms are therefore inverted.

## The Rate per Cent., and Time.

22°. At what rate per cent. compound interest, convertible half-yearly, may a sum of £369, due five years hence, be discharged by the immediate payment of £268 6s. 9d.?

The difference between the logs of the principal of the sum due, equals the log of the amount of £1 at the of the term, which is the amount of one interval raised the power of the number of intervals. This log, then, me sured by the number of intervals, gives the log of the amou of £1 for the first interval, which, counted by the interval in a year, will give the rate per pound for one year.

1·0348 1

·0343 Interest for the half-year.

2

·0686 Rate per pound per annum.

 $\div$  100

6.86 Rate per cent. per annum, or £6 17s.  $2\frac{1}{2}$ 

In how many years will £452 6s., at 4 per cent. comporting the set, convertible half-yearly, amount to £645 19s.  $11\frac{1}{44}$ 

The amount of £1 at the end of the term equals sum divided by the principal, or the difference of the 1 of the sum and principal equals the log of the amo of £1 in one year, raised to the power of the number years. This log contains the amount of £1, at the of the first interval, as many times as the number of in vals. To find the number of years, this divisor mercounted by the number of periods of conversion in or

2.8102302 log of 2.6554266

Log of  $(1.021) \times 2 = 0.0172004) 0.1548036$  (9 years. 0.1548036

# PRESENT VALUE OF SUMS AT COMPOUND INTEREST.

23°. The present value of £1 to be received at the end of one year is the sum which at compound interest, will produce that amount at the end of the term. The amount of £1 at 3 per cent. compound interest, payable at the end of the year, may be thus expressed  $(1 + .03)^1$ . The present value of this sum, being the reverse of this operation, is expressed algebraically by  $(1 + .03)^{-1}$ , which signifies the reciprocal of 1 + .03, or  $\frac{1}{1 + .03} = .9708$ . One pound to be received at the end of two years equals  $(1 + .03)^{-2}$ , or  $\frac{1}{1 + .03^{-2}}$ ; £1 at three years equals  $(1 + .03)^{-3}$ , &c.

On this principle Table IV. is constructed, which gives the present values of £1 at various rates per cent. from one to fifty years, from which the present value of any other sum at

the same rate may be found.

## Examples.

What is the present value of £237, due at the end of seventeen years, at 4 per cent. compound interest?

#### Statement.

What sum in seventeen years will produce £237, if in the same time £1.9479 be produced by £1?

$$\left\{\begin{array}{c} x \\ 1.9479 \end{array}\right\} = \left\{\begin{array}{c} 287 \\ 1 \end{array}\right\} = 121.67.$$

By Table IV. the question becomes a direct proportion.

What is the present value of £237, due in a given time, if the present value of £1 in the same time equals .5134?

$$\begin{bmatrix} x \\ 1 \end{bmatrix} = \begin{bmatrix} 287 \\ .5134 \end{bmatrix}$$
 121.67, or £121 13s. 5d.

What sum will a present payment of £219 7s. 6d. entitle a person to at the end of twelve years, interest 3 per cent.?

#### Statement.

What will be the amount in twelve years, of 219.875 if in the same time £1 produce 1.4258?

The sum of £249 7s. 8d. was paid for the present value of a sum to be received eight years hence; what will the person making the payment be then entitled to, allowing 8 per cent. compound interest, payable quarterly?

#### Statement.

What is the amount of £249.383; if in one interval £1 produce 1.02, how much in 32 intervals?

N.B. The interest of £1 in the first interval is 1 of 08,

or  $\cdot 02$ , and there are  $8 \times 4 = 32$  intervals.

$$\begin{bmatrix}
\mathbf{x} \\
\mathbf{1} \\
\mathbf{1}
\end{bmatrix} = \begin{bmatrix}
249.383 \\
(1.02)^{1} \\
32
\end{bmatrix} \log 0.0086002 \\
\underline{0.2752064} \\
2.3968673 \log \text{ of } 249.383.$$

$$2.6720737 = 469.973, i.s. £46919s. 5 3d.$$

What is the present value of £350, due seven years hence, allowing 6 per cent. compound interest, payable quarterly?

#### Statement.

Required the present value of £350, interest convertible in 28 intervals, if  $(1.015)^1$  be produced in one interval by £1.

#### The Time.

24°. A legacy of £1500 was exchanged for a present pay-

ment of £1219 12s. 9d., reckaning interest at 3 per cent.

How many years hence was the legacy due?

The difference of the logs of the present value and the sum due equals the log of the amount of £1, at the end of the term, which must be measured by the log of the amount of £1 at the end of one interval to give the number of years or intervals.

$$£1500 = log \ 3.1760913$$
  
1219.687 = log 3.0862305

$$1.03 = \log 0.0128372$$
)  $0.0898608(7 \text{ years.} 0.0898608$ 

Or, by Table IV., what is the present value of £1, if 1219 637 be the present value of £1500?

$$\binom{x}{1500} = \binom{1}{1219.637} = 81309$$
, present value of £1 in 7 yrs.

The sum of £249 7s. 8d. was paid down in lieu £469 19s. 6d., the discount allowed being 8 per cent. compound interest, payable quarterly. How long was the sumpaid before due?

Amount in one interval,

 $1.02 = \log 0.0086002$  2.6720737 log of 469.978, 4 2.3968673 log of 249.388

Amount in one year 0.0344008) 0.2752064 (8 years. 0.2752064

## The Rate per Cent.

25°. A owes B £327, payable at the expiration of twelvers, which A is allowed to discharge by the immediate payment of £204 4s.  $10\frac{1}{2}d$ .; what is the rate per cent. compound interest?

Amount of £1 per Annum in any Number of Years, not exceeding fifty.

Or, the difference of the logs of the sum due and present value gives the log of the amount of £1 in twelve years, at the given rate, which, divided by twelve, gives the amount, with interest, of £1 at the end of one interval:

0.0170333 = 1.04, or 4 per cent.

At what rate per cent. compound interest, payable quarterly, may a sum of £469 19s. 6d., due in eight years, be discharged by the immediate payment of £249 7s. 8d.?

Log of sum = 2.6720737Log of principal = 2.3968673  $0.2752064 \div 32$  intervals = 0.0860645= 1.02 per quarter.

·08 per pound per annum, or 8 per

## ANNUITIES AT COMPOUND INTEREST.

26°. The sum of a series, in which each term is multiplied by a common difference, equals the first term, multiplied by the difference between unity and that power of the common ratio whose index is equal to the number of terms, divided by the product of the difference between unity and the common ratio. A series of this kind is called a "geometrical progression," and the sum of its terms, taken at each step from 1 to 50, is the principle on which Table V. is constructed, which gives the amount of £1 per annum at various rates per cent., the common ratio being the interest, thus:

What is the amount of £1 per annum, at 4 per cent. com-

pound interest, in five years?

#### Statement.

What is the amount in five years of £1 per annum if ·04 is its interest for one year? But instead of one year we have five, minus one year's interest.

The amount of an annuity is the sum of a series of terms in geometrical progression. On inspecting the above series, it appears that the first payment is simply £1, and that the series contains six times the annuity and five times the interest; and that the amount in one year is multiplied by itself four times, or the given number of years minus one. The nth power of a number, we have seen, is that number multiplied by itself n-1 times, therefore a number multiplied by itself n times, is the n+1th power, The rule, then, is—raise the amount of £1 in one year to the power of the number of years, deduct unity from the product, and divide by the interest of £1 for one year.

## Examples.

#### The Amount.

What will an annuity of £33 17s. 9d. amount to in fourteen years, at 4 per cent. compound interest?

#### Statement.

What is the amount of £33.8875 per annum, if .04 be the interest of £1 for one year, and fourteen years' interest of £1 equals .7317?

$$(1 + .04)^{14} = 1.7317$$
, amount of £1 in fourteen years.  
 $\begin{pmatrix} x \\ 04 \\ 1 \end{pmatrix} = \begin{cases} 33.8875 \\ 1 \\ .7817 \end{cases} = 619.866.$ 

## By Table V.

What will be the amount of an annuity of £234 in eight years, at £4 6s. per cent. compound interest?

## The Annuity.

27°. The usual rule for finding the annuity is - "Multiply the amount of the annuity by the interest of £1 for one year, and divide the product by the amount of £1 in the given time, less one."

The interest of £1 for one year must be counted by the number of pounds or parts of pounds in the sum, the sum being composed of one year's amount, multiplied by itself n-1 times, which will give n-1 times the compound in terest of £1; this, measured by the amount of £1 in n years, less one, will give the n-1th part of one year's income er annuity.

What annuity, accumulating at 37 per cent. compound

interest, for forty years, will amount to £600?

#### Statement.

What annuity will amount to £600, if the interest of £1, in forty years, equals 3.3604, and the interest per pound **=** ⋅0375 ?

This is an inverse proportion; the greater the annuity the fewer times will it be contained in 600 times, the interest.

At the expiration of ten years, £280 will be required for the renewal of a lease; what sum, at 5 per cent. compound interest, should be annually laid by to produce that amount?

By Table V. the amount of £1 per annum, in ten years.

equals 12.5779.

www.libtool.com.cn

$$\begin{pmatrix} x \\ 12.5779 \end{pmatrix} = \begin{pmatrix} 289 \\ 1 \end{pmatrix} = 22.9768, i.e., £22.19s.  $6\frac{1}{2}d.$$$

#### The Time.

28°. Find the interest of £1 for the number of years, which, divided by the annuity and unity added, will give the amount of £1, at the given rate, for the whole term. The log of this product contains the log of the amount of £1 in one year as many times as the number of years in the term.

In how many years will an annuity of £8 per annumamount to £187 6s.  $9\frac{3}{2}d$ ., at 3 per cent. compound interest?

## 29°. The Rate per Cent.

is so involved in questions of this kind, that no concise method can be given by which it may be accurately brought out; nor is there any algebraic process yet discovered that affords any other than an approximate solution.

At what rate per cent. will £25 per annum amount in ten

years to £347 12s. 84d.?

The following statement will give the amount of £1 per annum for the whole term:

$$\begin{pmatrix} x \\ 25 \end{pmatrix} = \begin{Bmatrix} 1 \\ 347 634 \end{pmatrix} = 13.90536.$$

On comparing this result with a table, it will be seen that the amount of £1 per annum, at 7 per cent., in ten years, equals 13.81644, which, deducted from 13.90536, leaves a difference of 08892, or about 1s. 9½d more than 7 per cent.

Present value of £1 per Annum for any Number of Years, not exceeding fifty.

Years.         3 per Cent.         4 per Cent.         5 per Cent.           1         .970874         .961538         .952381           2         1913470         1:886095         1:859410           3         2:828611         2:775091         2:723448           4         3'717098         3'629895         1:545951           4         3'717098         3'629895         3'545951           5         4'579707         4'451822         4'229477           6         5'417191         11124170m         5'75692           7         6'230283         6'002055         5'75692           7         6'230283         6'002055         5'75692           7         6'230283         6'002055         5'75692           7         786109         7'435332         7'107822           10         8'530203         8'1060477         8'306414           11         9'254024         8'760477         8'306414           12         9'954004         9'385048         9'393573           11         9'254024         8'760477         8'306414           12         9'954004         9'385048         9'393573           13         10'1375185	1000117 14140	or 21 per 22mmum for	any Mainber of Tear	s, not exceeding nity

What will an annuity of £25 amount to in nine years, at 6 per cent. compound interest, when annuity and interest are payable half-yearly?

$$\begin{bmatrix} 25 \\ 1 \\ 06 \end{bmatrix} = \begin{bmatrix} 25 \\ (1.03)^{18}, \text{ or } .7024 \text{ int.} \end{bmatrix} + 292.67 \text{ i.e., } 2292 13s. 6d.$$

## Or by Table V.

What is the amount of half an annuity of £25, if £1 in eighteen years, at 3 per cent., equals 23.414?

## PRESENT VALUES OF ANNUITIES AT COMPOUND INTEREST.

30°. If there were no interest of money, the amount of £1 to be received at the end of one year would be the same as £1 received now, i. e.,  $\frac{1}{1} = 1$ ; but if 03 interest can be made in a year of £1, the fractions become

$$\frac{1}{1+\cdot 03} \quad \frac{1}{(1+\cdot 03)^3} \quad \frac{1}{(1+\cdot 03)^3} \quad \frac{1}{(1+\cdot 03)^4}$$

being, respectively, the present values of £1, to be received at the end of 1, 2, 3, and 4 years.

If we deduct from £1 the whole amount of the sum that would produce it, at the end of four years, what remains is £1, minus its present value if paid four years hence, or the discount of £1; for, as each pound is to be paid at the end of each year, there is the present values of £1, for 1, 2, 3, &c., years, to be deducted respectively from each pound. We make the whole deduction from £1, and the remainder will contain the interest of £1 for one year, as many times as the years by which it has been reduced.

## Examples.

What is the present value of £1 per annum for four years, if 1 - .8884 is the discount for four years, and .03 is produced in one year by £1?

$$\begin{bmatrix} x \\ 1 \\ .03 \end{bmatrix} = \left\{ \begin{array}{c} 1 \\ 1 - .8884 \\ 1 \end{array} \right\} = 3.717.$$

What is the present value, at 5 per cent., of the lease of an estate for nineteen years, worth £214 per annum, the rent being £60 per annum?

Deduct the rent from the income for the value of the annuity which is to be purchased; 214 - 60 = £154. Present value by Table VI., of £1 per annum for nineteen years, = 12.0853.

$$\begin{bmatrix} x \\ 1 \end{bmatrix} = \begin{bmatrix} 154 \\ 12.0853 \end{bmatrix} = 1861.13 = £1861 2s. 7\frac{1}{4}d.$$

What sum will be required for the purchase of an annuity of £25, to continue twelve years, interest £4 5s. per cent.?

Log of 
$$1 = 0.0000000$$
  
0.0180761 log of 1.0425, amount of £1 in one year.

1 9819239 log of present value of £1, to be received in one year.

 $\overline{1.7830868} = .60685$ , present value of £1 in twelve years.

#### Statement.

What is the value of an annuity of £25, if present value of £1 in twelve years equals (1 — 60685), and 0425 is the interest of £1 for one year?

For how many years may an annuity of £25 per annumbe purchased for £231 5s.  $2\frac{1}{5}d$ ., interest £4 5s. per cent.?

The 25th part of the present value will be the present value of £1 per annum, for the whole term. By comparing this amount with Table VI., the column nearest the amount of interest will give the number of years.

$$\left\{\begin{array}{c} x\\25 \end{array}\right\} = \left\{\begin{array}{c} 1\\281\cdot2612 \end{array}\right\} = 9\cdot25045.$$

which reads—what is the present value of £1 per annum, in the number of years, if £25 per annum equal 231.2612. The answer 9.25045, comes the nearest to the tabular value at twelve years, under the column headed 4 per cent.

An annuity of £25 per annum for 23 years, was sold for £800 19s.; what was the rate per cent.?

$$\begin{pmatrix} x \\ 25 \end{pmatrix} = \left\{ \begin{pmatrix} 1 \\ 800.95 \end{pmatrix} \right\} = 12.307.$$

Tabular value of £1 per annum, for 23 years, at nearly 6 per cent.

#### PERPETUITIES.

31°. An annuity to continue for ever is called a perpetuity. The present value of a perpetuity is the sum that will produce the annual interest at the given rate per cent.

## Examples.

What is the present value, at 3 per cent., of a perpetuity of £3 per annum?

$$\begin{bmatrix} x \\ 03 \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix} = £99.$$

What is the present value of an estate in fee simple, of \$563, when the interest of money is 5 per cent.?

$$\begin{bmatrix} x \\ .05 \end{bmatrix} = \begin{bmatrix} 563 \\ 1 \end{bmatrix} = £11,260.$$

What perpetuity will £856 purchase, when the rate of interest is  $9\frac{1}{2}$  per cent.?

$$\left\{ egin{array}{l} x \\ 1 \end{array} \right\} \; = \; \left\{ egin{array}{l} 856 \\ .035 \end{array} \right\} \, 29.96, \, \emph{i. e. } \pounds 29 \, 19\emph{s. } 2\frac{1}{2}\emph{d.} \end{array}$$

### REVERSIONS.

82°. An annuity which is not to be entered upon until after the expiration of a term of years, is called a reversionary or deferred annuity. The present value of a deferred annuity is the difference between the present value of an annuity to begin immediately and continue until the expiration of the reversion and an annuity to continue until the time of entering on the reversion.

What is the present value of the reversion of £40 per annum, for seven years, to be entered upon after the expiration of twelve years; interest 4 per cent.?

13·13393 present value of £1 per annum for 19 years. 9·38507 ,, for 12 years.

3·74886 ,, ,, for 7 years, d ferred 12 years

$${x \choose 1} = {40 \choose 3.74886} = 149.9544$$
, or £149 19s. 1d.

What Deferred Annuity may be purchased for a given sum

The difference between the present values of £1 pannum for the whole term, and the present value of a per annum to continue until the commencement of the deferred term, will be the present value of £1 annuity the deferred term. Divide the purchase money by the difference for the annuity required.

What annuity, to continue nine years after the expirate of the next twelve years, may be purchased for £14 interest 5 per cent.?

12.821153 present value of £1 per annum for 21 years 8.863252 ,, for 12 years

3.957901 , , for the defer term.

## REVERSIONS IN PERPETUITY.

33°. Required the present value of the reversion of perpetuity of £62 per annum, to be received at the expira of fourteen years, at 4 per cent.

Present value, by table, of £1 due in 14 years = .505

$$\begin{bmatrix} x \\ 1 \\ .04 \end{bmatrix} = \begin{bmatrix} .62 \\ .5051 \end{bmatrix} = £782 \ 18s. \ 8d.$$

The reversion of a fee simple estate, after twelve years, sold for £640 17s. 5d.; what annual return should it be roduce to allow the purchaser 4 per cent. interest for his onev?

The purchase money, counted by the interest of £1, gives be whole annual income for the present time; but as this as become is to be deferred twelve years, the present income just be counted by the amount of £1 deferred to that ears, briod.

$$\begin{cases} x \\ 1 \\ 1 \\ 1 \end{cases} = \begin{cases} 640.8708 \\ 04 \\ 1.601 \end{cases} = 41.0413, i. e., £41 0s. 10d.$$

#### RENEWAL OF LEASES.

f. f. 84°. The present value of an annuity deferred for the unue of bired term of the lease, and then to continue for the
riod renewed, will be the fine required for the renewal of
number of years expired in a lease.

en su

number of years expired in a lease.

Fifty years having expired in a lease for the term of sixty rs, what sum should be paid for renewing them, supposing estate to produce a clear rental of £240 per annum, and for interest of money 5 per cent.?

18.9293 present value of £1 per annum for 60 years.

7.7217 for 10 years, the unexpired term.

unexpired term 11:2076 present value of an annuity of £1 for 50 years.

term 51d 89·824 =£2689 16s. 51d.

$${x \choose 1} = {240 \choose 11 \cdot 2076} = £2689 16s. 5 4d.$$

sion thirty years having expired in a lease for forty years, what le exp will be required for renewing ten years of the same, posing the yearly rental £70, and the rate of interest = 500 cent. ?

13:5903 present value of £1 per annum for 20 years.
8:1109 ,, ,, for 10 years, the unexpired term.
5:3794 present value of an annuity of £1 for 10 years.

www.libtool.com.cn

383.558

$${x \choose 1} = {70 \choose 5.4794} = £383 11s. 13d.$$

#### MISCELLANEOUS CALCULATIONS.

35°. What is the interest of £462 10s., for six years and five days, at 4 per cent.?

$$\begin{bmatrix} x \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 462.5 \\ .04 \\ 6.0136 \end{bmatrix} = £111 5s. 0\frac{1}{4}d.$$

What will be the amount, in seven years, of £756, at 4½ per cent.?

$$\begin{bmatrix} x \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 756 \\ 045 \\ 7 \end{bmatrix} = \begin{bmatrix} \text{Interest. Principal.} \\ 238.14 + 756 = £994 \ 2s. \ 93d. \end{bmatrix}$$

Required the interest of £7000 for 230 days, at 4 per cent.

$$\begin{bmatrix} x \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 7000 \\ 04 \\ 6301 \end{bmatrix} = 176.428, i.e., £176.8s. 6\frac{1}{2}d.$$

What is the amount of £573, in six years, at 5 per cent compound interest?

Amount by Table III. of £1 in six years, 1.3401.

$$\left. \begin{array}{c} x \\ 1 \end{array} \right\} = \left\{ \begin{array}{c} 573 \\ 1.8401 \end{array} \right\} = £767 \ 17s. \ 6\frac{1}{2}d.$$

Required the amount of £346 17s. 9d., in eight years, at 4 per cent. compound interest.

What is the present value of £943, to be received at the end of fifteen years, reckoning 3 per cent. compound interest?

Present value by Table IV. of £1 due in fifteen years, 6419.

$${x \choose 1} = {945 \text{WW.libtool.com.cn} \atop .6419} = £605 \text{ 6s. } 5\frac{1}{4}d.$$

Required the amount, by Table V., of £60 per annum in nine years, at 4 per cent. compound interest.

$$\begin{bmatrix} x \\ 1 \end{bmatrix} = \begin{bmatrix} 60 \\ 10.5828 \end{bmatrix} = £634 \ 19s. \ 4\frac{1}{2}d.$$

What is the present value, by Table VI., of a temporary annuity of £75 18s., for twelve years, at 4 per cent. compound interest?

What annuity, by Table VI., may be purchased for £639 17s. 4d., for nine years, at 4 per cent. compound interest?

$$_{7\cdot4353}$$
 =  $\left\{ \begin{smallmatrix} 639\cdot8667 \\ 1 \end{smallmatrix} \right\}$  = £86 1s.  $1\frac{1}{2}d$ .

Required the present value of a deferred annuity of £80, to be entered upon at the expiration of twelve years, and then to be continued for seven years, at 4 per cent. compound interest.

13·1339 pres. val., by Table VI., of £1 per an. for 19 years. 9·3851 ,, for 12 years.

3.7488 pres. val. of an annuity deferred 12 years to continue 7 years.

$${x \atop 1}$$
 =  ${80 \atop 3.7488}$  = £299 18s. 1d.

A freehold estate produces £120 per annum; what is the

present value of the perpetuity, reckoning 4 per cent. interest?

$${x \choose 4} = {120 \choose 100} = £3000, \text{ or } {x \choose 04} = {120 \choose 1} = £3000.$$

A holds a freehold estate of £250 per annum, on a lease, which has twelve years to run; what sum ought B to give, to come into possession of the estate at the end of that time, reckoning interest at 5 per cent.?

$$\begin{pmatrix} x \\ 1 \\ 5 \end{pmatrix} = \begin{Bmatrix} 250 \\ 100 \end{Bmatrix} = £3123.$$

What perpetuity, to be entered upon fourteen years hence may be purchased for the sum of £2644 9s. 6d., reckoning interest at 3 per cent.?

$$\begin{bmatrix} x \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 2644 \cdot 475 \\ \cdot 03 \\ 1 \cdot 5126 \end{bmatrix} = £120.$$

A freehold estate, producing £75 per annum, is mortgaged for the period of fourteen years; what is its present value at 4 per cent.?

$$\begin{bmatrix} x \\ 04 \end{bmatrix} = \begin{Bmatrix} 75 \\ 1 \end{Bmatrix} = £1875$$
, present value of £75 per annum.

At how many years' purchase must a freehold estate be bought, that the purchaser may have 5 per cent. for his money; that is, in how many years will the estate produce the money paid as its present value?

Number of Persons Living and Dying at every Age, according to the Northampton Estimate.

## www.libtool.com.cn

## PART II.

### THEORY OF PROBABILITIES.

36°. Nothing is more uncertain than the duration of life as regards an individual; but when our inquiries involve a large number—for instance, ten thousand persons born alive on the same day—by observing how many survive at the termination of each year, till all are deceased, an average duration of life for every individual may be obtained, sufficiently accurate for all calculations of annuities and life assurance.

The probability of any event happening, is the ratio of the number of favorable cases, or those which contribute to its production, to the number of cases favorable and unfavorable. It appears, by the Carlisle Table of Mortality, that, out of 10,000 persons born alive on one day, 8461 survive the first year. The probability of a child surviving the first year is, then, the ratio 8461:10,000, or the fraction  $\frac{8461}{10,000}$ The following is the general formula or ratio for the probability of attaining a given age:  $\frac{lm+n}{lm}$ ; in which lm+n equals the number living at the increased age, and lm the number living at the present age. If the probability of death before a given age be required, the fraction becomes—

Number dying between the present and increased ages

Number living at the present age

The theory is applicable to nearly all contingencies, enabling us to calculate the amount of chance, or inability to perceive causes, which interferes with the certainty of any

expected event; its investigation is as useful in exposing the fraud or folly of gambling, as in providing against reverses over which we have no control.

Since probability is expressed by a fraction, unity expresses certainty. If a bag contain two white balls, the certainty of drawing a white ball is  $\frac{1}{1}$ , or unity; but if it contain one white and two black balls, the probability of drawing a white ball becomes the fraction  $\frac{1}{3}$ , or the ratio 1 to 3, respecting which we should say, that the odds are two to one against drawing a white ball. Let P represent the probability of any event; m, the number of cases favorable to its production; and

$$n$$
, the number of unfavorable cases; then  $P = \frac{m}{m+n}$ .

The above may afford a general idea of the theory of probabilities sufficient for the practical purposes of this work. Those who require a more intimate acquaintance with this interesting branch of mathematical reasoning, may consult the treatise of De Morgan, or that by Jones in his elaborate work on Annuities and Reversions.

We now proceed to the consideration of annuities contingent on individual life, in which this new element will be introduced into our calculations.

#### Illustrations.

37°. What is the probability, according to the Northampton Table, that a person now aged twenty will attain the age of fifty?

#### Statement.

What is the individual probability out of 2857 persons living at fifty years of age, on 5132 living at twenty?

$$\begin{pmatrix} x \\ 5132 \end{pmatrix} = \begin{pmatrix} 1 \\ 2857 \end{pmatrix} = .5567$$
, probability.

What is the probability of a life of forty-five failing to survive one year?

#### Statement.

What is the individual probability out of 78 persons dying between the ages of forty-five and forty-six, on 3248 persons living at forty-five?

$$_{3248}$$
 $=$  $\left\{ \begin{array}{c} 1\\78 \end{array} \right\} = \cdot 024.$ 

As unity expresses certainty, the probability of failure is equal to the difference between the probability of attaining a given age and unity.

What is the expectation of life for a child aged three years?

#### Statement.

What is the individual expectation of life out of 264,834, being the sum of the living at the several ages beyond three years, if 6781 be the number living at three years of age?

$$\binom{x}{6781} = \left\{ \frac{1}{264834} \right\} = 39.05 + .5 = 39.55 \text{ years.}$$

Half unity, or  $\cdot 5$ , is added to complete the average for those who die in the course of the year.

## CONTINGENT OR LIFE ANNUITIES.

38°. In the Northampton Table of Mortality, Table VII., of 11,650 persons born, 8650 survive one year, 7283 survive two years, 6781 survive three years, and so on till they all become extinct.

If, when the interest of money is 3 per cent., it were required to provide at the time of birth £1 for each of the 11,650 who survive one year, it appears that £8650 would be paid among them at the end of a year; the present value of which,  $8650 \times (1.03)^{-1}$ , is the sum which will provide for the payment of £1 to each survivor, which,

divided by 11,650, gives  $\frac{8650 \times (1.03)^{-1}}{11,650}$ , the sum to be contributed on behalf of each.

TABLE VIII.

Expectation of Life at every Age, according to the Northampton Estimate.

Age.	Expectation	<b>₩ <del>\$g</del>e.</b> ] į	o Experiention m	CIAge.	Expectation.

	35.85	48	19.00	80	4.75
17	35.50	49	18.49	18	4·4I
18	34.28	50	17'99	82	4.09
19	33.99	51	17.20	83	3.80
20	33'43	52	17.02	84	3.28
21	32.90	53	16.24	85 86	3.37
22	32.39	54	16.06	86	3.18
23	31.87	55 56	15.28	87	3.01
24	31.36	56	15.10	88	2.86
25	30.82	57	14.63	89	2.66
26	30.33	58	14.12	90	2.41
27	29.82	59	13.68	91	2.08
28	29.30	60	13.51	92	1.72
29	28.79	61	12.74	93	1.37
30	28.27	62	12'28	94	1.02
31	27.75	63	11.81	95 96	.75
32	27.24	64	11.35	96	.20

We have seen that  $(1.03)^{-2}$ , or  $\frac{1}{(1.03)^2}$ , is the present value of £1 at 3 per cent., to be certainly received at the end of two years. In the former expression the present value is somewhat less, being diminished by the fraction  $\frac{7283}{11650}$ , the chance of the individual not surviving the term which would entitle him to the sum.

The present value of the sum to be received at the end of the first year being  $(1.03)^{-1}$ , at the end of the second year  $(1.03)^{-2}$ , the third year  $(1.03)^{-3}$ , &c., multiplied respectively by the probabilities of not surviving that term, the following is the method by which Table IX, is constructed, which gives the present values of an immediate annuity of £1 at the various ages of life.

Multiply the number living at each year of age, by the present value of £1, due at the end of the same number of years as the age; then the present value of the annuity at any age is found by dividing the sum of the products at all the ages above that on which the annuity depends, by the

product at that age.

The policy, or title to an annuity, is received when the purchase-money is paid down; but the first payment of an immediate annuity commences at the expiration of the first equal interval at which the annuity is made payable, from the time of entering on possession.

#### Illustration.

What is the present value of an annuity of £1 on a life aged 95, at 3 per cent.?

·0603 present value of £1 due in 95 years. 4 number living at 95.

.2412

·0585 present value of £1 due in 96 years.

1 number living at 96.

$$\frac{.0585 \times 1}{.0603 \times 4} = \frac{.0585}{.2412} = .242$$
, pres. val. of annuity of £1 at 95.

#### Statement.

What is the individual portion of the present value 0585 of £1, to be received by the only survivor at 96, if 2412 is the present value of £1 to each of four survivors at 95?

$$\left\{\begin{array}{c} x \\ \cdot 2412 \end{array}\right\} = \left\{\begin{array}{c} 1 \\ \cdot 0585 \end{array}\right\} = \cdot 242.$$

Value of an Annuity of £1 on a Single Life, at every Age, according to the Northampton Table of Mortality, at the several rates of 3, 4, and 5 per cent. per annum.

### IMMEDIATE ANNUITIES.

39°. What is the present value by Table IX. of an annuity of £40, payable yearly, during a life aged forty-five; interest 3 per cent.?

WWW.libtool.com.cn

$${x \choose 1} = {40 \choose 13.692} = 547.68.$$

Required the present value, by Table IX., of an annuity of £20, payable half-yearly, on a life aged thirty-five; interest 4 per cent.?

$${x \choose 1} = {20 \choose 14 \cdot 289} = 285 \cdot 78.$$

Required the present value of an annuity, at 5 per cent., of £60, payable quarterly, on a life aged thirty.

Add 375 to the tabular value for the quarterly payment.

$${x \choose 1} = {60 \choose 13.447} = 806.82.$$

A gentleman aged forty-five, holding the lease of an estate during life, of the clear annual rent of £60, one year's payment of which is just due, wishes to dispose of the same; what is the value of the title, the rate of interest being 4 per cent.?

N.B. In calculating annuities with one year's payment, due at the beginning of the year, add unity to the tabular value of £1 annuity.

# WHAT ANNUITY A GIVEN SUM WILL PURCHASE.

40°. An annuity on a life aged forty-five, was purchased for the sum of £684 12s.; what was the amount of the annuity, allowing interest at 3 per cent.?

$${}_{13\cdot692}$$
 =  ${684\cdot6 \choose 1}$  = £50.

An annuity, payable half-yearly, on a life aged twentyseven, was purchased for the sum of £1362 14s.; what was the amount, at 5 per cent. interest ? OM.CO

$$(13.777 + .25)$$
 =  ${1362.7 \choose 1}$  = £100 per annum, payable half-yearly.

### DEFERRED ANNUITIES.

41°. The present value, or single premium for an annuity to be received at the expiration of a given time, equals the value of an annuity at the increased age, counted by the present value of £1, to be received at the end of the deferred term; but since the payment of the annuity is dependent on individual life, this present value must be counted; that is, diminished by the probability of the life attaining the in-

creased age.

To find the annual premium, or the average value of the deferred annuity for one year of the term, deduct from £1, or unity, its present value if paid at the end of the deferred term, at the given rate of interest, convertible yearly, counted by the probability of the given life surviving that term. This product is the discount of £1 for the deferred term, diminished by the probability. Add this product to the difference between the values of an annuity at the present age and an annuity deferred to the increased age. The single premium, divided by this product, will give the annual premium.

It is obvious that the same rule will apply for the finding of the half-yearly or quarterly premiums, provided the present value of £1 be substituted, with the interest convertible at these periods, and one-half or one-fourth of the result

taken.

# Examples.

42°. What is the present value of the reversion of an annuity of £50, payable yearly, during the remainder of a life aged forty-five, after the age of fifty-five; rate of interest 3 per cent.?

#### Statement.

Let rd be the general expression for the present value of

£1 due at the end of any deferred term,  $a_m$  present value of an annuity of £1 at m years of age; Pm, n, probability of a life agod m living n years; then,

What premium ought to be given now to secure an annuity of £67 19s. 9d., payable half-yearly, during a life now aged seventeen, after the next thirteen years; interest 4 per cent.?

The single premium for a deferred annuity of £50, at 3 per cent., payable yearly, during the remainder of a life aged forty-five, after the age of fifty-five, is 312.619. What are the annual and half-yearly premiums, payable at the beginning of each year and half-year?

$$1 - (.744 \times .7537) + (13.692 - 6.253) = 7.889,$$
  
average for one year.

$${x \choose 7.889} = {1 \choose 312.619} = 39.6273$$
, or £39 12s.  $6\frac{1}{2}d$ ., annual premium.

$$(1 + .05)^{-20} = .61027,$$

present value of £1 in ten years, convertible half-yearly;

$$1(.61027 \times .7537) + (13.692 - 6.253) = 7.979,$$
  
average for two half-years.

$${7 \cdot 979} = {1 \choose 312 \cdot 619} = {39 \cdot 1802 \over 2} = £19 \ 11s. \ 9\frac{3}{4}d.$$

half-yearly premium.

The sum of £400 was paid for the purchase of a life annuity, at the age of thirty-six, to commence at the expiration of nine years; required the amount of the annuity, interest 4 per cent.

# TEMPORARY ANNUITIES.

43°. The present value of a temporary annuity is equal to the difference between the present values of a deferred annuity of £1 on the given life, and an annuity for the whole term of life.

For temporary annuities payable at the beginning of each year, add unity to the present value of an annuity for one year less than the given term, payable at the end of each year.

What is the present value of an annuity payable yearly, for the next ten years, on a life aged forty-five; rate of interest 3 per cent.?

Notation.

present value of an annuity deferred n years on a life aged m.

present value of an annuity for the next n years on a life aged m.

What premium ought to be given to secure an annuity of £67 19s. 9d., payable half-yearly, for the next thirteen years, provided a person aged seventeen survive so long; interest 4 per cent.?

Required the present value of the lease of an estate for fifty years on the life of a boy aged twelve years, valued at £350 per annum, out of which the tenant has to pay various charges, to the amount of £65 annually; rate of interest 4 per cent.

N.B. In questions of this kind, reserved rent, tithe, taxes, and all other charges, must be deducted, to ascertain the clear annual rent.

$$\begin{array}{l}
x\\r^{50}\\a_{69}\\P_{12,50}
\end{array} = \begin{cases}
1\\ \cdot 1407\\8 \cdot 547\\8 \cdot 547\\3363
\end{cases} = \cdot 4044 \ a_{\overline{12}}|_{50}$$

$$17 \cdot 251 \ a_{12}$$

$$\cdot 4044$$

$$\overline{16 \cdot 846 \ a_{\overline{12}}|} \times (350 - 65) = £4801 \ 5s. \ 6d.$$

# DEFERRED TEMPORARY ANNUITIES.

44°. The present value of a deferred temporary annuity is the difference between an annuity deferred for the given term, and an annuity deferred for the given term *increased* by the period of the temporary annuity.

When a reversionary annuity is secured by an annual premium, the first payment is usually made immediately, and the subsequent payments at the end of each year, until the reversion is entered upon.

The divisor for the annual premium for a deferred temporary annuity of £1 paid down, and £1 at the end of each year for n years, equals the deferred annuity divided by unity, plus a temporary annuity for the deferred term.

$$\frac{a_{\overline{n}|_{n}}}{1+a_{\overline{n}|}}$$

i.e., to find the annual premium necessary to secure an annuity for ten years, to be entered upon at the expiration of eight years, divide the present value of the deferred temporary annuity by unity, added to the present value of an annuity for eight years.

$$\frac{a_{m}|_{8}}{1+a_{m}|}$$

What are the single and annual premiums for an annuity of £1, to be entered upon at the expiration of eight years, and then to continue ten years, subject to the existence of a life now aged forty-five; interest 4 per cent.?

$$\begin{vmatrix}
x \\
r^{8} \\
a_{53} \\
P_{45,8}
\end{vmatrix} = \begin{cases}
1 \\
.7807 \\
10.687 \\
.804
\end{cases} = 6.2504$$

$$\begin{vmatrix}
x \\
r^{18} \\
a_{63} \\
P_{45,18}
\end{vmatrix} = \begin{cases}
1 \\
.4987 \\

\end{cases} = 2.2596$$

6.2504 
$$a_{\overline{45}}|_{s}$$
2.2596  $a_{\overline{45}}|_{10}$ 

3.9908 single premium for  $a_{45}$ , deferred 8 years, to continue 10 years.

$$\begin{array}{ccc}
12.283 & a_{45} \\
6.25 & a_{45|_{3}} & (1 + 6.033) = 7.033. \\
\hline
6.033 & a_{45|_{3}} & (1 + 6.033) = 7.033.
\end{array}$$

$$\frac{3.99}{7.03} = .576$$
, or 11s.  $4\frac{1}{2}d$ ., annual premium.

### INCREASING AND DECREASING ANNUITIES.

 $45^{\circ}$ . The calculation of increasing and decreasing aunuities is somewhat complicated, and requires the construction of a preparatory table consisting of three columns, of which the first should contain the products of the number living at each age, multiplied respectively by the present values of £1 to be received at the end of the same number of years as the age; the second should contain the sum of the products of the same factors at all ages above; the third, the sum of the products of the same factors at the given age, and all ages above. Let these columns be distinguished as A, B, C, and let  $l_m$  represent the number living at the given age,  $r^m$  present value of £1 to be received at the end of m years.

The following is the general formula for the present value of an annuity of £1 at thirty years of age last birthday, in-

creasing a each year; interest 3 per cent.

$$\frac{1 - \cdot 125 \times (l_{31} \times r^{31} + \text{all ages above}) + \cdot 125 \times (l_{30} \times r^{30} + \&c.)}{A}$$

$$(l_{30} \times r^{30})$$

If the annuity be taken for £40, increasing £5 each year, the formula becomes,

$$\frac{40-5\times(l_{31}\times r^{31}+\&c.)+5\times(l_{30}\times r^{30}+\&c.)}{(l_{30}\times r^{30})},$$

which is the same as,

$$\left(\frac{l_{31} \times r^{31} + \&c.}{l_{30} \times r^{30}}\right) \times 85 + \left(\frac{l_{30} \times r^{30} + \&c.}{l_{30} \times r^{30}}\right) \times 5$$

that is,  $(a_{30} \times 35) + \&c.$ , or, the present value of an immediate annuity of £35 added to the present value of an annuity at the same age of £5, increasing £5 every year. The following exhibits the principle more plainly:—

1° payment is increased by 
$$\frac{r^{30}\times l_{30}}{r^{30}\times l_{30}}\times 5=\pounds 5.$$
  
35 + 5 = £40.

2° payment is increased by  $\frac{r^{31} \times l_{31}}{r^{30} \times l_{30}} \times 5$ , present value of  $a_{30}$  of £5 for two years. 35 + 10.

3° payment is increased by  $\frac{r^{32} \times l_{20}}{r^{30} \times l_{30}} \times 5$ , present value of  $a_{21}$  of £5 for three years. 35 + 15, &c. &c.

When the quantities A, B, C, are previously calculated, the terms may be stated in two equations; the first being simply the usual form of finding the value of an annuity of £35, by Table IX.

and 592·27 1234·77

ŀ

1827.04 present value of  $a_{30}$  of £40, increasing £5 yearly.

For the same annuity decreasing £5 every year, the formula becomes:—

$$a_{30} \times 40 + 5 - \left(\frac{l_{90} \times r^{30} + \&c.}{l_{30} \times r^{30}}\right) \times 5.$$

As in the former example, the first payment being exactly £40, the amount of *decrease*, 5, must be *added* to the annuity to compensate for its deduction from the first payment.

# TEMPORARY INCREASING AND DECREASING ANNUITIES.

46°. The following is the formula for an annuity of £40, on a life aged thirty, for ten years, increasing £5 every year.

$$\begin{array}{c} a_{\overline{30}|} \times \\ (40-5) + (l_{30} \times r^{30} + \&c. - l_{40} \times r^{40} + \&c.)_{10} + (l_{41} \times r^{41} + \&c.)_{10} \\ \hline (l_{50} + r^{30}) \end{array}$$

For the same annuity decreasing £5 each year, the formula becomes—

$$\begin{array}{c|c} a_{\overline{30}|} \times \\ \underline{(40+5)-(l_{30}\times r^{30}+\&c,-l_{40}|\times r^{40}+\&c,)_{\bullet}5-e(l_{41}\times r^{41}+\&c,)_{\bullet}5}} \\ \underline{(l_{30}\times r^{30})}. \end{array}$$

# PREPARATORY TABLE FOR THE CALCULATION OF ANNUITIES.

47°. The following statement, taken at the oldest age but three, presents, at a glance, the method of constructing the Preparatory Table in Jones's work on Annuities, so far as the first three columns. Each column contains opposite each age, the sum of the products of the following factors:—

Age. A. B. C. 
$$\begin{vmatrix} l_{93} \times r^{93} & l_{94} \times r^{94} \\ l_{95} \times r^{95} & l_{96} \times r^{95} \\ l_{96} \times r^{96} & l_{96} \times r^{96} \end{vmatrix} \begin{vmatrix} l_{93} \times r^{93} \\ l_{94} \times r^{94} \\ l_{95} \times r^{95} \\ l_{96} \times r^{96} \end{vmatrix}$$

#### ENDOWMENTS.

48°. To find the present value of a sum of money to be received at the end of a given number of years, dependent on individual life.

The present value of £1 due at the end of the term, must be counted by the probability that the given life will survive the term.

When the endowment is secured by an annual payment, divide the single premium by a temporary annuity for one year less than the deferred term; but as the first payment is usually made immediately, add unity to the temporary annuity before dividing.

If the premium be payable half-yearly, or quarterly, add 25, or 375 in finding the value of the deferred annuity, and

again before subtracting for the temporary annuity.

## Examples.

Required the present value, in a single payment of £300,

to be received at the end of fifteen years, provided a person now aged twenty, shall be then living; interest 4 per cent.

### TABLE X.

Value of the Reversion, or the Single Premium for the Assurance of £1, payable at the end of the Year in which a given Life shall fail, deduced from the Northampton Table of Mortality, at the several rates of 3, 4, and 5 per cent. per annum.

A gentleman, aged thirty-six, will be entitled to receive the sum of £1000 at the expiration of fifteen years, provided he survive the term. What annual premium, payable half-yearly, ought he to receive in lieu of it, reckoning interest 5 per cent. per annum?

present value of endowment in a single payment.

$$\begin{pmatrix} x \\ r^{14} \\ a_{50} + .25 \\ P_{36, 14} \end{pmatrix} = \begin{pmatrix} 1 \\ .505 \\ 10.519 \\ .726 \end{pmatrix} = 8.8578,$$

annuity at 36, deferred fourteen years, payable half-yearly

$$(3.8573 + .25) = \underbrace{\begin{array}{c} 12.377 \ a_{ss} \\ 4.107 \\ \hline 8.269 \end{array}}_{\begin{array}{c} \underline{a_{s6}} \\ 14 \end{array} \text{ payable half-yearly.}$$

$$(8.269 + 1) = \frac{339.326}{9.269} = 36.6087, i. e., £36 12s. 2d.,$$

annual premium, payable half-yearly.

# General Formula.

To find the annual premium necessary to secure a sum of money payable in n years. Let s equal the present value of the endowment, then

$$\frac{s}{a_{\frac{m}{n-1}}}$$
 = annual premium.

# ASSURANCES ON LIVES.

49°. A life assurance is an engagement to secure the payment of a sum on the death of an individual, in consideration of a stipulated single or annual payment.

The present value of a perpetuity, or the sum that will produce a perpetual annuity of £1, at 3 per cent., is  $\frac{1}{.03}$ , and 38.33. If, from this perpetuity we deduct 13.45, the present

value of an immediate annuity at forty-six, the difference, 19.883, is the present value of the perpetuity of £1, to be received on the death of a life aged forty-six. If this be divided by the present value of a perpetuity to be received immediately, or the principal that will produce £1 per annum for ever, it will give the principal that will produce £1 at the end of the life, or the present value of the reversion of £1; but, as the premium is usually paid at the time of effecting the assurance, add unity to the perpetuity before dividing.

By this method, Table X. may be constructed, which gives

By this method, Table X. may be constructed, which gives the present values of the reversion of £1, at various ages, at 3, 4, and 5 per cent., according to the Northampton table

of mortality.

The annual premium is an annuity, of which the first payment is made in advance; therefore, the single premium, divided by an annuity on the given life, plus 1, equals the annual premium. If the premium be payable half-yearly, deduct 25; if quarterly, 375, from the annuity.

The annuity of £1 at the same age being calculated on the same probability, is evidently a measure of its annual value; but, as the annuity ceases at death, while the reversion is usually paid at the end of the year in which the life may fail, the annuity is increased by unity before dividing.

# Examples.

50°. Required the premium in a single payment, to assure £1 at the death of a person aged fifteen, reckoning interest 4 per cent.

## Statement.

What is the present value of the reversion of £1, if 25 + 1 is the present value of £1 per annum for ever, to be received immediately, the first payment in advance; and £25 —  $16.771 a_{15}$ , i. e., 8.209, is the present value of the same perpetuity to commence on the decease of a life aged fifteen?

$$\begin{pmatrix} x \\ 26 \end{pmatrix} = \left\{ \begin{array}{c} 1 \\ 8 \cdot 209 \end{array} \right\} = \cdot 31573,$$

present value of the reversion of £1 on a life aged 15.

What premium ought to be paid for the assurance of £500 n a life aged forty-five, to be received at the end of the year in which the life shall fail, interest 4 per cent.?

Let  $R_m$  equal the value of the reversion of £1, at m years of age.

$$\begin{pmatrix} x \\ R_{48} \end{pmatrix} = \begin{pmatrix} 500 \\ 48912 \\ WWW. 11 brook.com.cn \end{pmatrix} = £244 11s. 2 \frac{1}{4}d.$$

Required the annual premium, payable yearly and half-yearly, for the assurance of £100 on a life aged forty-three, interest 3 per cent.

annual premium, payable half-yearly; £1 17s.  $5 \pm d$ ., half-yearly payment.

A person aged forty-two pays an immediate sum of £1000, and an annual premium for the assurance of £5000 on his life. What annual premium will be required, rate of interest 3 per cent.?

$$_{\mathbf{R}_{42}}^{x}$$
 =  $\left\{\begin{array}{c} 5000 \\ .55171 \end{array}\right\}$  =

2758.55 single premium to assure £5000. 1000 deduct present payment.

 $1758.55 \div 15.391$ ,  $a_{12} + 1 = £114.58$ . 2d., ann. premium.

What single premium is equal to £1 annual premium, for the assurance of a life aged forty-five, interest 3 per cent.?

$$\left\{ \begin{array}{c} x \\ a_{45} + 1 \end{array} \right\} = \left\{ \begin{array}{c} 1 \\ 14.692 \end{array} \right\} = 14.692.$$

The reversion of £100, secured by a policy of assurance on a life aged forty-five, was purchased for the sum of £57 4s. 2d. Required the annual premium, interest 3 per cent.

$$\frac{x}{14.692} = \left\{ \begin{array}{l} 57.2075 \\ (a_{45} + 1) \end{array} \right\} = £3 \ 17s. \ 10\frac{1}{2}d.$$

S. America

# ASSURANCES WITH A LIMITED NUMBER OF

51°. We have seen that the present value of a reversion must be measured by an annuity on the given life, plus 1, to find its annual premium. On the same principle, the divisor for the annual premium for a limited number of years, is a temporary annuity, increased by unity for the same term. But since the first premium is paid in advance, and the remainder at the end of each year, the annuity must be taken for one year less than the given term, according to the following formula:—

$$\frac{a_{m}}{a_{m-1} + 1} = \text{annual premium, limited to } n \text{ payments.}$$

What premium, limited to ten annual payments, the first immediately, ought to be given for a policy of assurance for £100, on a life aged forty-five, the payments to cease in case of death before the end of the term; interest 3 per cent.?

#### Statement.

What is the annual value, limited to ten payments, of a reversion, if an annuity at forty-five, for nine years, increased by unity, be the present value of £1 at the end of each year of the term?

$$\frac{.57207 \text{ R}_{43}}{7.878 \left(a_{\frac{-1}{4}} + 1\right)} = .07262 \times 100 = 7.262,$$
 annual premium for £100.

#### DEFERRED ASSURANCES.

52°. If the assurance is to commence after a term of years, the value of the reversion at the increased age must be counted by the probability of the given life surviving that term, and by the present value of £1 to be received at the end of the term.

The annual premium, when the first payment is made immediately, is obtained by dividing the single premium by a temporary annuity increased by unity, for one year less than the number of years deferred.

### www.libtool.com.cn Examples.

Required the value of an assurance deferred eleven years, on a life aged forty-five; rate of interest 3 per cent.

$$\begin{vmatrix}
x \\
R_{45+11} \\
P_{45,11} \\
r^{11}
\end{vmatrix} = \begin{cases}
1 \\
.6539 \\
.7284 \\
.7224
\end{cases} = .34412,$$

present value of reversion of £1 deferred eleven years.

$$\frac{.34412}{8.44 \left(a_{\frac{13}{10}} + 1\right)} = .040778$$
, annual premium.

A sum payable at the death of a person aged sixty, and subject to his surviving ten years beyond that age, amounted to £900; required what that sum was, supposing the rate of interest 5 per cent.

$$\frac{\mathbf{x}}{\mathbf{R}_{70}} \left. \begin{array}{c} \mathbf{x} \\ \mathbf{R}_{70} \\ \mathbf{P}_{60, \ 10} \\ \mathbf{r}^{10} \end{array} \right\} = \left\{ \begin{array}{c} 900 \\ .6656 \\ .6045 \\ .6139 \end{array} \right\} = £222.305.$$

# TEMPORARY ASSURANCES.

53°. A temporary assurance is the difference between an assurance for the whole term of life and an assurance deferred for the given period.

As in the last example, the divisor for the annual premium is the present value of a temporary annuity increased by unity, for one year less than the given term.

If the assurance be required for one year only, multiply the present value of £1, due one year hence, by the probability that the given life will die in the year.

The following is the general formula for an assurance on a life aged m, for the term of n years.

$$\frac{\left(\mathbf{R}_{m}-\mathbf{R}_{\overline{m}|_{n}}\right)=\mathbf{R}_{\overline{m}|}}{\left(\frac{a_{\overline{m}}|}{a_{\overline{m}}|}+1\right)} = \text{annual premium.}$$

$$\frac{\left(\mathbf{R}_{m}-\mathbf{R}_{\overline{m}|_{n}}\right)}{\left(\frac{a_{\overline{m}}|}{a_{\overline{m}}|}+1\right)} = \text{annual premium.}$$

$$\frac{\mathbf{R}_{m}}{\mathbf{R}_{m}} = \mathbf{R}_{\overline{m}} = \mathbf{R}_{\overline{$$

Required the value of the reversion of £1, on a life aged forty-seven, for seven years hence; interest 5 per cent.

$$\frac{x}{R_{54}} \\ \frac{x^7}{r^7} \\ P_{47,7} \end{aligned} = \begin{cases} \frac{1}{\cdot 49681} \\ \cdot 710681 \\ \cdot 81824 \end{cases} = \cdot 28889, \text{ reversion at forty-seven, deferred seven years.}$$

$$\frac{\cdot 43886}{\cdot 28889} \frac{R_{47}}{R_{47}} \\ \frac{\cdot 28889}{\cdot 14996} \frac{R_{47}}{R_{47}} = \text{present value of reversion of } \mathfrak{L}1, \text{ for 7 years.}$$

Required the annual premium to assure the sum of £100 on a life aged forty-five, in case of death during the next eleven years; interest 3 per cent.

$$\begin{bmatrix} x \\ \mathbf{R}_{56} \\ \mathbf{7}^{11} \\ \mathbf{7}_{44,11} \end{bmatrix} = \begin{bmatrix} 1 \\ .65392 \\ .7224 \\ .72845 \end{bmatrix} = .34412 \ \mathbf{R}_{\overline{49}|_{11}}$$

.57207

·34412 deduct.

 $22795 = R_{\frac{1}{11}}$  i. e., present value of reversion of £1 for eleven years.

$$\begin{vmatrix} x \\ r^{10} \\ a_{57} \\ P_{47, 10} \end{vmatrix} = \begin{pmatrix} 1 \\ .744 \\ 10.611 \\ .73867 \end{pmatrix} = 5.832 \ a_{\overline{47}|_{10}}$$

13.203

5.832

<sup>7.371</sup>  $a_{\overline{q}}$  temporary annuity at forty-seven, for ten years.

$$\frac{22795 \,\,\mathbf{R}_{\overline{45}}}{(7\cdot371 \,\,a_{\overline{45}}^{-1})} = 02723 \times 100 = 2\cdot723 \begin{cases} \text{annual premium for temporary assurance of } \pounds100, \\ \text{at forty-five.} \end{cases}$$

# ASSURANCES FOR ONE YEAR.

54°. The value of an assurance for one year is equal to the present value of £1 to be received at the end of the year, counted by the probability of the given life failing to survive one year.

# Example.

Required the premium for the assurance of £100, for one year, on a life aged twenty; interest 3 per cent.

Probability, by Table VII., of a life of twenty failing in one year  $=\frac{72}{5132}$ , or 0140296.

$$\left(\begin{array}{c} x \\ P_{20, 1} \\ r^1 \end{array}\right) = \left(\begin{array}{c} 1 \\ 014029 \\ 97087 \end{array}\right) = 0136238 \times 100 = 1.362, \text{ or } 0.36238 \times 100 = 1.36238 \times 100 =$$

## VALUE OF POLICIES.

55°. Since a policy of assurance secured by a periodical premium consists of an annuity paid to the office, for the expectation of a given sum at the decease of the person assured, the seller of a policy exonerates himself from all future payments of the annuity, and also abandons the benefit of the reversion. Therefore, supposing the annual premium just due and not paid, from the value of the reversion at the increased age, subtract the present value of an annuity, plus one, at the increased age, multiplied by the annual premium paid at the commencement of the policy. Thus, the present value of the reversion will be reduced by a sum equal to the present value of all the future premiums.

If, on the other hand, the premium has been just paid, we must add its amount to the above value.

# Example.

What is the present value of a policy of assurance of £100 on a life aged forty-five, and which has been ten years in

existence; the annual premium, which is just due, being £3 17s.  $10\frac{1}{2}d$ .; rate of interest 3 per cent.?

$$\begin{array}{c}
 x \\
 (a_{ss} + 1) \\
 \hline
 (a_{ss} + 1)
 \end{array} = \begin{cases}
 3.8937 \\
 12.15
 \end{array} = (47.3089)$$

$$\begin{array}{c}
 64.611 R_{ss} \times 100 \\
 47.308
 \end{array}$$

17.303 *i. e.*, £17 6s.  $0\frac{3}{4}d$ ., value of policy.

56°. Value of a Bonus, or Addition to a Policy.

Multiply the amount of the bonus by the present value of a reversion at the given age.

## Example.

Required the present value of £240 added to a policy on a life now aged fifty; interest 3 per cent.

$$_{\mathbf{R}_{50}}^{x} \left\{ = \left\{ \begin{array}{c} 240 \\ \cdot 6086 \end{array} \right\} = £146 \text{ ls. } 6d.$$

57°. What reduction of Annual Premium is equivalent to a given Bonus.

Deduct from the annual premium the annual premium that will assure the amount of the bonus at the increased age.

# Example.

What reduction of annual premium is equivalent to a bonus of £50, on a life now aged thirty-three; rate of interest 5 per cent.?

Annual premium for £1 at 33 
$$= \{ \begin{array}{c} x \\ 50 \\ .02516 \end{array} \} = £1 5s. 2d.$$

equivalent sum to deduct from annual premium.

# PART III.

www.libtool.com.cn

# JOINT AND SURVIVORSHIP ANNUITIES AND REVERSIONS.

58°. The calculation of joint and survivorship annuities requires a voluminous series of tables, adapted to every difference in ages. These tables, being of very limited interest, and withal too large for publication at a moderate price, are usually kept in manuscript at the various life assurance offices. They are all calculated on the principles elucidated in the preceding portions of this work. It is, therefore, determined to give formulæ for the most useful cases, by a method of notation not quite so abstract as that of pure algebra, rather than swell the size of the volume with specimen tables, for the mere purpose of working exercises.

#### PROBABILITIES ON JOINT LIVES.

59°. To find the probability that two given lives shall both survive a certain number of years, or attain a given age.

Required the probability of two persons aged twenty and

thirty respectively both surviving ten years.

$$\frac{l_{(20+10)}}{l_{20}} \times \frac{l_{(30+10)}}{l_{30}}, i.e., (P_{20,10} \times P_{30,10}) = P_{20,30,10}$$

joint probability of lives aged twenty and thirty surviving ten years.

To find the probability that the joint existence of two given lives shall fail in a certain number of years.

Required the probability that two given lives, aged twenty and thirty, shall fail within ten years.

Unity expresses certainty; therefore,

$$(1 - P_{20.30,10}) = P_{20.30,10}^{dd}$$
 Probability of death within ten years, on two lives aged twenty and thirty.

To find the probability that two given lives shall survive a given term.

$$(1 - P_{20.30, 10}^{dd}) = P_{20.30, 10}^{dd}$$
 { probability of both lives surviving ten years.

To find the probability that of two given lives only one of them shall survive a given term.

$$(P_{20, 10} + P_{30, 10}) - 2 (P_{20, 30, 10}) = P_{20, 30, 10}$$
, probability that one of two lives aged 20 and 30 shall live ten years.

To find the probability that one of two given lives shall survive, and that the other shall die in a given term.

What is the probability that a life aged twenty shall survive, and that another aged thirty shall die in ten years?

$$P_{20, 10.} \times \left(\frac{l_{30} - l_{40}}{l_{30}}\right)$$
, or  $P_{30, 10}^{\ \ d} = P_{20, 30}^{\ \ l}$ , 10

probability that age 20 shall live and 30 shall die within ten years.

# ANNUITIES ON JOINT LIVES.

60°. The following statement from the Northampton table may serve as a general formula for the construction of tabular values of annuities on joint lives.

Required the present value of an annuity on two joint lives, aged eighty-five and ninety.

Let  $r^{91}$ , as before, represent present value of £1, to be received at the end of 91 years, at the given rate per cent., then:

$$\frac{r^{91} \times l_{91} \times l_{86} + \text{all ages above 91}}{r^{90} \times l_{90} \times l_{85}} \Big\} = a_{85.90}$$

immediate annuity on joint lives 85 and 90.

Required, the present value of an annuity on two joint lives aged twenty-eight and thirty-three, deferred seven years.

$$(r^7 \times a_{28.33.} \times P_{28,7.} \times P_{33,7.}) = a_{28.\overline{33}|_{7}}$$

annuity on joint lives 28 and 33, deferred 7 years.

Value of a Deferred Annuity in annual payments.

Required the annual premium payable at the beginning of each year for an annuity on two joint lives, aged twenty-eight and thirty-three deferred seven years.

$$\frac{a_{28.\overline{33}}|_{7}}{(r^{7} + P_{28,7} \times P_{33,7}) - (1 + a_{28.33} - a_{28.33}|_{7}} =$$
annual premium,

Required the present value of a temporary annuity, for the next ten years, on two joint lives, aged respectively twentyseven and thirty-two.

$$(a_{27.32}) - (a_{27.\overline{32}}|_{10}) = a_{27.\overline{32}}|_{10}$$

annuity on joint lives aged 27 and 32 for 10 years.

# ASSURANCES FOR THE JOINT EXISTENCE OF TWO LIVES.

61°. Required the present value, in a single payment, of an assurance of the reversion of £1, to be received at the end of the year in which either of two given lives, say ten and fifteen, may fail.

Let p represent present value of a perpetuity of £1, and R present value of the reversion of £1 at the given rate per

cent., then:

$$\frac{p - a_{10.15}}{p + 1} = R_{10.15},$$

value in a single payment of the reversion of £1, to be received on one of two lives aged 10 and 15.

$$\left. \frac{\mathbf{R}_{10.15.}}{a_{10.15}+1} \right\} = \text{annual premium for the same}$$

What is the present value of a deferred assurance survivor of two lives, aged respectively twenty-seven and thirt, two, provided they both survive the term of eleven years?

$$R_{38.43} \times P_{38.43,11} = R_{38.\overline{43}|_{11}}$$

present value of reversion on lives 38 and 43, deferred 11 years.

$$\frac{R_{38.\sqrt{43}}}{a_{38.\sqrt{43}}} + 1$$
 www.libtool.com.cn annual premium for the same,

Required the present value in a single payment of a temporary assurance for ten years on two joint lives, aged thirty-three and thirty-eight.

$$(R_{33.38}) - (R_{33.38}|_{\overline{10}}) = R_{33.\overline{38}}|_{\overline{10}}$$

single premium for ten years' assurance on lives 33 and 38.

$$\left. \frac{\mathbf{R}_{33.3\hat{\mathbf{s}}}}{a_{33.\hat{\mathbf{s}}\hat{\mathbf{s}}}} \right| = \text{annual premium for the same.}$$

Required the premium for a reversion on two lives aged twenty and twenty-five, on the contingency of their both surviving one year.

F

怞

ani Pot

$$r^1 \times (P_{20,25})^{dd} = R_{20,\frac{-5}{1}}$$

present value of reversion for one year on lives 20 and 25.

# ENDOWMENTS ON JOINT LIVES.

62°. Required the value, in a single payment, of an endowment to be received at the end of fifteen years, provided two persons aged twenty and twenty-five shall then be both living.

$$r^{15} + (P_{20.25, 15}) = E_{20.\overline{25}|_{15}}$$

present value of endowment deferred fifteen years.

$$\frac{\mathbf{E}_{20,\frac{7}{25}\big|_{15}}}{a_{20,\frac{7}{25}\big|}} = \text{annual premium for the same.}$$

## VALUE OF POLICIES, ETC., ON JOINT LIVES.

63°. Required the present value of a policy of assurance effected on two joint lives, when at the ages of thirty-five and forty, now ten years of age. libtool.com.cn

Let A represent annual premium paid at the commence-

ment of the policy, then:

$$A_{35.40} \times (a_{45.50} + 1) R_{45.50} = \text{present value.}$$

Required the present value of a bonus added to a policy on two joint lives, now aged forty-eight and fifty-three.

Let B represent the amount of bonus, then:

$$R_{48.53} \times B =$$
present value.

A policy of assurance was effected on two joint lives, when at the ages of thirty-four and thirty-nine respectively, to which at the expiration of ten years a reversionary bonus was added. What reduction in annual premium is the equivalent value of the bonus?

 $A_{44,49} \times B =$  equivalent reduction.

# SURVIVOR OF TWO LIVES.

64°. Probability that of two given lives the survivor of them will outlive a certain number of years.

Required the probability that the survivor of two lives, whose respective ages are eighteen and twenty-three, will outlive the term of ten years.

$$(P_{18.10.} + P_{23, 10}) = P_{\overline{18.23, 10}}^{v}$$

probability that of two lives, 18 and 23, survivor shall outlive ten years.

Required the probability that the survivor of two lives, whose respective ages are eighteen and twenty-three, shall fail to outlive the term of ten years.

$$(P_{18, 10}^d + P_{23, 10}^d) - (P_{18, 23, 10}^d) = P_{\overline{18, 23, 10}}^v$$

probability that of two lives 18 and 23, survivor shall dier within ten years.

į

# ANNUITIES ON TWO LIVES AND THE SURVIVOR

65°. Required the present value of an annuity to continue during two lives and the survivor of them.

Let the respective ages be fifteen and twenty, then:

$$(a_{15} + a_{20}) - (a_{15 \cdot 20}) = a_{\overline{15} \cdot \overline{20}}$$

annuity on both lives and the survivor.

What are the values in single and annual payments of an annuity deferred twenty years, on two lives and the survivor, ages seventeen and twenty-two?

$$(a_{17}|_{20} + a_{22}|_{20}) - a_{17.\overline{22}}|_{20} = a_{17.\overline{22}}|_{20}$$
 single premium.

$$\frac{a_{.7} \cdot \frac{v}{22}\Big|_{20}}{(r^{20} \times P_{22, 20.}) - (1 + a_{22} - a_{\overline{22}}\Big|_{20.})} \quad \text{annual premium.}$$

Required the present value of a temporary annuity, should both or either of two lives, aged eighteen and twenty-five, live twelve years.

$$(a_{\overline{18.25}}) - (a_{18.25}|_{12}) = a_{\overline{18.25}|_{12}}^{\underline{v}}$$

# ASSURANCES ON THE LAST OF TWO LIVES.

66°. What present sum is required to assure £1, to be received at the end of the year in which the last of two lives, aged nineteen and twenty-four, may die?

$$\frac{p-a_{\frac{p}{19\cdot 24}}}{p+1} = R_{\frac{p}{19\cdot 24}}, \text{ single premium.}$$

$$\frac{R_{\frac{\sigma}{19-24}}}{(a_{\frac{\sigma}{19-24}}+1)} = \text{annual premium.}$$

o find the value of the same, in annual payments, for a ven number of years only.

Let n represent the given term of years.

$$\frac{R \atop \frac{d}{2} \cdot \frac{d}{24}}{a \atop \frac{19 \cdot \frac{34}{24}}{n-1}} = \text{annual premium for } n \text{ years.}$$

$$\frac{d}{d}$$

Let the ages be eighteen and twenty, and the assurance on the last of the two lives deferred ten years, then:

Again, let the ages be eighteen and twenty, and the assurance as above, but temporary, for the term of ten years, then:

$$(R_{\frac{d}{18.20}}) - (\frac{d}{18.20}|_{10}) = R_{\frac{d}{18.20}}$$

When the reversion is for one year only, the present value is

$$\left(r^{1} \times \mathbf{P}_{18 \cdot 20}^{d}\right) = \mathbf{R}_{\frac{d}{18 \cdot 20}}^{d}$$

#### ENDOWMENTS.

67°. Required the value of an endowment on two lives, aged eighteen and twenty, to be received at the end of ten years, provided both or either survive that term.

$$(r^{10} \times P_{\frac{v}{18.20,10}}) = E$$
, present value in single payment.  

$$\frac{E}{a_{\frac{v}{18.20|}}} = \text{annual premium.}$$

# VALUE OF POLICIES ON LAST OF TWO LIVES.

68°. Required, the present value of a policy of assurance effected on the last survivor of two lives, at the respective ages of forty-seven and fifty-two, now ten years ago.

$$A_{47.52} \times (a_{\overline{57.62}}^{v} + 1) - R_{\overline{57.62}}^{v} = \text{value of policy.}$$

$$(B \times B_{\overline{57.62}}^{v}) = \text{value of bonus on same policy.}$$

$$(A_{\overline{57.62}}^{v} \times B) = \text{equivalent reduction in annual premium.}$$

# SURVIVORSHIP ANNUITIES.

69°. Required the value of an annuity on a life aged twenty-five, to commence after the death of another person of the same age,

$$(a_{25} - a_{25, 25}) = \text{single premium, or } a_{25|25}^{d}.$$

$$\frac{a_{25|25}^{d}}{(a_{25, 25} + 1)} = \text{annual premium.}$$

To find the value, after the extinction of the existing life or lives, of the next in succession to be then nominated to an annuity to continue—

- 1°. During a succeeding life,  $R_{so} \times (a_s + 1) = a_{s|so}^d$ , annuity at 8 years of age, after death of 59.
- 2°. During joint existence of two  $R_{59} \times (a_{8.25} + 1) =$ 
  - $a_{8.25|_{89}}$ , annuity on joint lives 8 and 25, after death of 59.
- 3°. During the last survivor of two lives,  $a_{\frac{v}{s.2s}|ss} \left\{ \begin{array}{l} a_{s,2s} \times (a_{\frac{v}{s.2s}} + 1) = \\ a_{\frac{v}{s.2s}|ss} \left\{ \begin{array}{l} a_{s,2s} + 1 \end{array} \right\} \\ a_{s,2s} = a_{s,2s} = a_{s,2s} \end{array} \right\}$

To find the present value of an annuity held during a given life, and also afterwards; namely, to commence at the end of the year in which the given life may fail—

- 1°. During another single life,  $R_{60} \times (a_{25} + 1) = a_{60|35}$ , annuity on life of 60, and then on a life of 25.
- 2°. During two joint lives  $R_{60} \times (a_{6136} + 1) = a_{60} |_{8.25}$  annuity on life of 60, and then on joint lives 8 and 25.
- 3°. During last survivor of two lives,  $R_{60} \times (a_{\frac{v}{6.25}} + 1) = a_{\frac{v}{60[8.25]}}$  annuity on life of 60, and then on last survivor of two lives, 8 and 25.

To find the present value of an annuity during the existing life or lives, and afterwards for a term of years certain.

Annuity on a life of fifty, and then to continue nine years.

$$R_{50} \times (a_{\frac{50}{9}} + 1) + a_{50}.$$

To find the present value of the reversion of a perpetual annuity, after the failure—

- 1°. Of a single life (age 40; p, perpetuity) ( $p a_{40}$ ).
- 2°. Of two joint lives . . . . . .  $(p a_{25.20})$ .
- 3°. Of last of two lives . . . . . .  $(p-a_{\frac{v}{70.75}})$ .

Let  $\angle_0$  represent present value of £1 per annum for nine years; then,

To find the present value of the reversion of what may remain of an annuity for a number of years certain, after the failure—

- 1°. Of an existing life (say 40 years of age) ( $\angle_9 a_{40}$ ).
- 2°. Of two joint lives (say 40 and 45) . ,  $(\angle 9 a_{49,45})$ .
- 3°. Of the last of two lives  $\ldots \ldots (\angle_9 a_{\frac{1}{49.44}})$ .

To find the present value of an annuity certain, for a given number of years, and afterwards to continue—

- 1°. During an existing life,  $\angle_{10} + a_{10-1}^{45}$ WWW.libtool.com.cn
- 2°. During two joint lives,  $(\angle_{10} + a_{\frac{35.45}{10-1}})$
- 3°. During the last of two lives,  $\left( \angle_{10} + a \frac{v}{\frac{35 \cdot 45}{10-1}} \right)$ .

To find the present value of an annuity to be divided equally between two persons during their joint lives, and to be reduced to one-half of the amount during the life of the survivor of them.

Let the ages be thirty-five and forty, then the formula becomes:

$$\frac{a_{33}+a_{40}}{2}$$
.

To find what sum each of two persons ought respectively to pay for an annuity to be equally divided between them, while they both continue to live, but which, on the death of either of them, is to belong entirely to the survivor.

Let the ages be respectively twenty-five and forty:

$$\left(a_{25} - a_{\frac{25.40}{3}}\right)$$
 = youngest person's contribution.

$$\left(\begin{array}{c} a_{40} - a_{\frac{23.40}{3}} \end{array}\right) = \text{eldest person's contribution.}$$

To find the present value of that part of an annuity granted on the longest of two lives, which may remain after the death of either of them, to a third person and his heirs, during the life of the survivor.

Let the respective ages be twenty-five and thirty:

$$a_{25} + a_{30} - 2 (a_{25.30}) = \begin{cases} \text{present value of remainder of annuity on death of either life.} \end{cases}$$

TABLE XI.

Decimals corresponding with every Pound in the Hundredweight.

# VARIOUS CALCULATIONS.

70°. All mathematical problems are questions of quantity, and may be solved by comparing, in various ways, known

quantities with unknown.

We have taken the symbol x as the representative of the amount of time, space, weight, &c., concerning which the question is asked; this symbol we place on the left side of the equation, and under it all the known or supposed terms, by which the opposite and similar terms on the right are to be measured or compared.

When the general question is—" If so much, how much

more?"—it is said to be in *direct* proportion, and there is no irregularity in the statement; but if, on the other hand, the question be—"If so much, how much less?"—the proportion is *indirect*, and quantities placed on the right, to be measured

by the left, must be transposed libtool.com.cn

It is difficult to frame a rule sufficiently abstract to meet all those cases—numerical enigmas—with which school arithmetics are usually filled; of rare occurrence, indeed, in actual business, but deemed valuable as exercises, or illustrations of a principle. For the last-mentioned purpose, we select a few such examples, containing a large number of terms. The following is the method most frequently used in forming statements of this kind.

Write all the known or supposed terms in one line, and under them the respective similar terms, concerning which the question is asked. The place of x will instantly be found under the corresponding term; then arrange the two columns by placing x on the left, opposite the known term of the same sort, as.

x days 20 days;

then in the left column write all the known terms, and opposite to them, on the right, all the similar terms which are to be measured by them. Compare now all the terms with x, and if in any case the answer be in opposition to the question, as, "the more the one, the less the other," the numbers must be transposed; for example:

If 15 men can dig a field 36 yards broad and 108 yards long in 9 days, working 8 hours a day, in how many days can 24 men, working 10 hours per day, dig a field 84 yards

broad and 288 yards long?

Men. 15	broad 36	l. long. 108	days. 9	hours. 8 known terms.
24	84	288	x	$10 \left\{ egin{array}{ll}  ext{unknown, and connected} \  ext{with } oldsymbol{x}. \end{array}  ight.$
æ	days	9 days.		
8	hours	10 hours.	{	The more hours, the fewer days: transpose.
108	long	288 long.	,	augs : cramspesser
36	broad	84 broad.		
15	men	24 men.	{	The more men, the fewer days: transpose.

#### True Statement.

Or the question may be stated as two equations, the first formed of the *known* terms, and the second of the *unknown* term and those connected with it, thus:—

which, worked together as the former statement, will evidently

produce the same result.

Again, without considering whether the proportions be direct or inverse, the terms may simply be set down according to the logical sequence of the ideas, as in the example below, which should be read down the left column and then down the right.

w—In how many days of 10 hours each can 24 men dig 36 yards broad and 108 long, if in 9 days
of 8 hours each
15 men
can dig 84 yards broad
and 288 long.

# Examples.

71°. If 84 men reap 72 acres in 15 days, how many acres will 96 men reap in 12 days?

If 10 months' provision for 180 boys cost £3760, what will be the cost of 12 months' provision for 96 boys?

What will be the value of value of yard, if yard cost £ 78?

$$\left. \begin{array}{l} \boldsymbol{x} \\ \boldsymbol{y} \\ \boldsymbol{\xi} \\ \boldsymbol{1} \end{array} \right\} = \left\{ \begin{array}{l} \frac{9}{14} \, \boldsymbol{y} \\ \boldsymbol{\xi} \\ \frac{7}{18} \\ 20 \boldsymbol{s} \end{array} \right.$$

Transpose 14 the denominators.
$$\begin{bmatrix}
4 & \text{Divide by } \\
9 & 3, \text{ the common measure.} \\
7 & \text{mon measure.}
\end{bmatrix} = \begin{bmatrix}
4 \\ 7 \\ 20\end{bmatrix} = 6s. 8d.$$

A can reap a field in 12 days, B in 6, and C, in 4 days; in what time can they all do it together?

To find the time required for A, B, and C unitedly to reap the field, the work must be measured by what they can all do together in one day.

Now A reaps  $\frac{1}{12}$ , B  $\frac{1}{6}$ , and C  $\frac{1}{4}$ , in one day. These fractions collected by reduction and addition, amount to  $\frac{1}{6}$ ; ...

What time will the work require if A, B, and C can perform  $\frac{12}{24}$  of it in one day?

Transpose  $\begin{pmatrix} x \\ \text{denominator.} \end{pmatrix} = \begin{pmatrix} 1 \\ 24 \end{pmatrix} = \frac{24}{12}$ , or 2 days.

One pipe alone will fill a cistern in 9 hours, a second alone in 6 hours; in what time can the cistern be filled by the two running together?

$$\left(\frac{x}{1} + \frac{1}{6} = \frac{15}{54}\right) = \left(\frac{1}{1 \text{ hour}} = \frac{x}{15}\right) = \left(\frac{1}{54}\right) \frac{54}{15}, \text{ or } 3\frac{3}{5} \text{ hours.}$$

If 15 persons can be maintained for 60 days on £80, how much money will support 96 persons for 300 days?

$$\begin{bmatrix} x \\ 15 \\ 60 \end{bmatrix} = \begin{bmatrix} 80 \\ 96 \\ 300 \end{bmatrix} = £2560.$$

What is the commission on £840 9s., at £3 per cent.?

$$\frac{x}{100} = \left\{ \begin{array}{c} 840.45 \\ \frac{3}{4} \end{array} \right\} = £6 \ 6s. \ 0\frac{3}{4}d.$$

What is the expense of insuring a cargo valued at £754; premium three guineas per cent., policy duty 5s. per cent.?

Reckon policy duty on £800 = £2.

Commission on £400 = 10s. Premium . . . £3 3s.  $\}$  = 3.65.

$$\therefore \begin{array}{c} x \\ 100 \end{array} = \begin{Bmatrix} 754 \\ 3.65 \end{Bmatrix} = 27.521 + 2 \text{ duty, } i. e., £29.10s. 5 \frac{1}{4}d.$$

The average rate at which 3 per cent. stock was created, by the various loans contracted from 1792 to 1802, was, in whole numbers, £57; what is the cost of a loan of £3,000,000 at this rate?

$${x \choose 57} = {3,000,000 \choose 100} = £5,263,157 \frac{7}{10}$$
, and 3 per cent. interest.

Multiply 
$$\frac{1}{3}$$
 by  $\frac{1}{4}$ .  $x \mid \frac{3}{4}$  transpose  $\frac{3}{4} = \frac{2}{3} = \frac{6}{12}$ , or  $\frac{1}{2}$ .

Divide 
$$\frac{4}{5}$$
 by 7.  $\begin{pmatrix} x \\ 7 \end{pmatrix} = \frac{7}{5} = \left\{ \begin{array}{c} 4 \\ 0 \end{array} = \frac{4}{35} \right\}$ 

Required the amount of 123 multiplied by 7.

How many pieces of eight at 56d. each, will answer a bill of £594 6s. sterling?

$$\binom{x}{.2393} = \binom{594.3}{1} = 2547.$$

Reduce 6 furlongs 16 poles to the fraction of a mile.

If 12 yards at London make 8 ells at Paris, how many ells at Paris will make 64 yards at London?

$$\begin{cases} x \\ 12 \text{ yds.} \end{cases} = \begin{cases} 64 \text{ yds.} \\ 18 \text{ ells} \end{cases} = 42\frac{8}{12} \text{ ells.}$$

Reduce \$\frac{4}{7}\$ to a fraction of the same value, whose denominator shall be 35.

A thousand quills cost eight shillings, at what price must they be sold to clear 20 per cent. and give six months' credit? i. e.,

What profit on 8s., if 100 gain £221?

$$\begin{pmatrix} x \\ 100 \end{pmatrix} = \begin{pmatrix} .4 \\ 22.5 \end{pmatrix} = .09 \text{ profit } + .4 = 9s. \ 9\frac{3}{4}d.$$

If 2 cwt. 1 qr. 7 lb. cost £8 14s. 4d., what will 14 cwt. 3 qrs. cost?

$$1.7450604 = 55.598$$
, or £55 11s. 11\frac{3}{4}d.

By the usual method, £55 11s.  $11\frac{1}{2} \frac{10}{37}d$ .

What is the value of  $\pounds_{13}^{5}$ ?

Reduce 3s. 3d. to the fraction and the decimal of a pound.

Reduce  $\frac{2}{530}$  of £1 to the fraction of a penny.

The sum of £115 was paid for income tax; what was the amount of the income, rate of interest 3 per cent.?

$${x \atop 3}$$
 =  ${115 \atop 100}$  = £3833 6s. 8d.

If the cost of a cwt. be 47s., how much is that per lb.?

$$\begin{cases} x \\ 7 \\ 1 \end{cases} = \begin{cases} 1 \\ 47 \\ 3 \end{cases} = 20\frac{1}{7} \text{ farthings, } i. e., 5\frac{1}{7} \frac{1}{7} d. \text{ per lb.,}$$

which illustrates the rule—"To find the price per lb., multiply the price of the cwt. in shillings by 3, divide the product by 7; the quotient will be the price of 1 lb. in farthings."

Remitted from London to Amsterdam, a bill of £754 10s. sterling; how many pounds Flemish is the sum; the exchange at 33s. 6d. Flemish per pound sterling?

$${x \choose 1} = {754.5 \choose 1.675} = £1263 15s. 9d.$$

Required the amount of one penny at 3 per cent. compound nterest, convertible yearly, from the year 1 to the year 1850.

$$\begin{cases}
x \\
£1 \\
1 \text{ yr.}
\end{cases} = \begin{cases}
00416 \\
(1.03)^1 \\
1850 \text{ yrs.}
\end{cases} =$$

£2,337,020,154,645,911,479,867 1s. 4d.

G. Woodfall and Son, Printers, Angel Court, Skinner Street, London.

# WORKS

#### BY JOHN WEALE. PUBLISHED

59. HIGH HOLBORN.

#### www.libtool.com.cn

In morocco, tuck, price 6s.,

ENGINEER'S AND CONTRACTOR'S POCKET THE BOOK.

REVISED.

In One large Vol. 8vo, Third Edition, revised and enlarged by H. Law, C.E., with engravings, price 21s. in strong half-morocco,

### MATHEMATICS FOR PRACTICAL MEN:

being a Common-place Book of Principles, Theorems, Rules, and Tables, in various departments of Pure and Mixed Mathematics, with their application especially for the use of Civil Engineers, Architects, and Surveyors.

#### By OLINTHUS, GREGORY, LL.D., F.R.A.S.

The plates are folded in the book, but spaced out for reference whilst reading any part of the work, and consist of

- 1 to 5. Geometrical diagrams.—250 figures.
   6. Details of a breast water-wheel.
   7. Fenton, Murray, & Co.'s steam-en-
- gine
- 8. A six-horse engine constructed by Thos. Middleton, London.
- A six-horse engine, slides, cylinder,
- 10. Longitudinal section of locomotive
- engine.
- 11. Transverse section of do.

  12. Sections of the cylinders of Woolf's engine, Cornish engine, and Atmospheric engine.
- 13. Isometrical perspective.

In One small Volume, with many plates and wood-cuts, Second Edition, corrected and improved, neatly bound, price 4s. 6d., the

#### OPERATIVE MECHANIC'S WORKSHOP COMPANION.

# THE SCIENTIFIC GENTLEMAN'S PRACTICAL ASSISTANT:

containing a great variety of the most useful Rules in mechanical science, divested of mathematical complexity; with numerous Tables of practical data and calculated results for facilitating mechanical and commercial transactions. By WILLIAM TEMPLETON, Author of several useful Practical Works.

In 18mo, in boards, comprising 390 pages, price 5s.,

## A SYNOPSIS OF PRACTICAL PHILOSOPHY.

alphabetically arranged, containing a great variety of Theorems, Formulæ, and Tables, from the most accurate and recent authorities in various branches of Mathematics and Natural Philosophy; with Tables of Logarithms.

By the Rev. JOHN CARR, M.A., late Fellow of Trinity College, Cambrid

#### WORKS PUBLISHED BY JOHN WEALE.

In 4to, with a large plate, price 3s. 6d., Description to Diagrams for facilitating the CONSTRUCTION OF OBLIQUE BRIDGES.

By W. H. BARLOW, C.E.

In 4to, with 12 large folding plates, extra cloth boards, price 14s., A PRACTICAL AND THEORETICAL

ESSAY ON OBLIQUE BRIDGES. By GEORGE WATSON BUCK, M. Inst. C.E.

In demy 8vo, with 107 woodcuts, extra cloth boards, price 7s., EXPERIMENTAL ESSAYS ON THE PRINCIPLES OF CONSTRUCTION IN ARCHES, PIERS, BUTTRESSES, ETC., MADE WITH A VIEW TO THEIR BRING USEFUL TO THE PRACTICAL BUILDER. By W. BLAND, Esq., of Hartlip, Kent.

In One Vol. royal 8vo, with several Illustrative Plates, price 2l. 2s., THE CONWAY AND MENAI TUBULAR BRIDGES.

WITH THE EXPERIMENTAL EXPLANATIONS. By WILLIAM FAIRBAIRN, C.E.

\*\_\* Some few copies of the Plates printed in folio, the text in 8vo, both very neat in half-morocco, price 2l, 15s.

#### STRENGTH OF MATERIALS.

In Two Vols. 8vo, price 1l. 4s., Fourth Edition, much improved and enlarged by EATON HODGKINSON, F.R.S., &c., Manchester; Vol. ii. being entirely composed of Mr. Hodgkinson's experiments,

A PRACTICAL ESSAY ON

# THE STRENGTH OF CAST IRON AND OTHER METALS:

Intended for the assistance of Engineers, Iron-Masters, Millwrights, Architects, Founders, Smiths, and others engaged in the construction of Machines, Buildings, &c.: containing practical Rules, Tables, and Examples founded on a series of new Experiments; with an extensive Table of the Properties of Materials. Illustrated by several Engravings and Woodcuts.

By THOMAS TREDGOLD, Civil Engineer.
